U.S. SUPPLEMENT
TO

ABS RULES FOR STEEL VESSELS FOR
VESSELS CERTIFICATED
FOR INTERNATIONAL VOYAGES

1 April 2011

AMERICAN BUREAU OF SHIPPING

USCG Approval: 3 May 2011 (16711/ABS)
MISSION STATEMENT

The mission of the American Bureau of Shipping is to serve the public interest as well as the needs of our clients by promoting the security of life, property and the natural environment, primarily through the development and verification of standards for the design, construction and operational performance of marine-related facilities.

QUALITY & ENVIRONMENTAL POLICY

It is the policy of the American Bureau of Shipping to be responsive to the individual and collective needs of our clients as well as those of the public at large, to provide quality services in support of our mission, and to provide our services consistent with international standards developed to avoid, reduce or control pollution to the environment.

All of our client commitments, supporting actions, and services delivered must be recognized as expressions of Quality. We pledge to monitor our performance as an on-going activity and to strive for continuous improvement.

We commit to operate consistent with applicable environmental legislation and regulations and to provide a framework for establishing and reviewing environmental objectives and targets.

CHECKLIST ON ACP CLASSIFICATION SURVEYS SLC
CHECKLIST ON ACP STATUTORY SURVEYS SLE
CHECKLIST ON ACP ENVIRONMENTAL SURVEYS AND MARPOL
V. SURVEYS DURING CONSTRUCTION
CHECKLIST ON ACP NEW CONSTRUCTION SURVEYS NCS
VI. PASSENGER VESSELS – SOLAS INTERPRETATIONS NOT ADDRESSED BY ABS RULES
VII. IBC CODE SUPPLEMENTAL REQUIREMENTS
VIII. IGC CODE SUPPLEMENTAL REQUIREMENTS
IX. REQUIREMENTS FOR OFFSHORE SUPPLY VESSELS (OSV’s) CERTIFICATED UNDER SUBCHAPTER L
X REQUIREMENTS FOR OCEANOGRAPHIC RESEARCH VESSELS CERTIFICATED UNDER SUBCHAPTER U
XI. GUIDANCE AND REFERENCES
XII. RECORD OF REVISIONS
INTRODUCTION

Those who use this Supplement are asked to review the current ABS Rules for Building and Classing Steel Vessels, 2004 SOLAS and 2006 MARPOL or latest. Please be aware of the “Scope and Conditions of Classification.” This Supplement does not change the scope or conditions of ABS Classification. It is a reference document within the ABS Quality System. The Check Sheets contained in this Supplement are also for reference only and are not to be used in the performance of a Survey. The controlled Check Sheets are available through the normal distribution of controlled documents. The most recent revisions may be obtained from the ABS Surveyor-in-Charge.

Historically, as part of their regulatory reform initiative, the United States Coast Guard (USCG) established a task group consisting of USCG personnel and ABS Engineers to conduct a comparison of the applicable requirements contained within Title 46 of the Code of Federal Regulations (CFR) Subchapters “D” and “I” to the similar applicable regulations contained in 1974 SOLAS (as amended), the International Convention for the Prevention of Pollution from Ships (MARPOL 73/78) and the ABS Rules for Building and Classing Steel Vessels. The purpose of this effort was to identify redundancies and to determine if the International Conventions and ABS Class Rules would provide an equivalent level of safety to those regulations contained within 46 CFR Subchapters “D” and “I”. Over 370 separate regulations were examined, and it was determined that many of the CFR requirements were satisfied by either the ABS Rules alone, 1974 SOLAS (as amended) alone, MARPOL 73/78 alone, or a combination of all three of these regulations.

The results of the task group’s study were codified into a document, subsequently modified to include Subchapter “H”, titled “U.S. Supplement to ABS Rules for Steel Vessels for Vessels on International Voyages, dated 1 August 1997.” After review, the ABS U.S. Supplement was reissued in 1999 and again in 2003. This U.S. Supplement to ABS Rules for Steel Vessels for Vessels Certificated for International Voyages” (2010 ABS U.S. Supplement) identifies those USCG requirements which are to be applied in addition to the 2009 ABS Steel Vessels Rules and requirements of the International Conventions in force as of 1 January 2009. This publication, subsequently modified to include Subchapter “L” & “U”, is used in lieu of 46 CFR Subchapters “D”, “H”, “I”, “L” and “U” for plan review and inspections delegated to ABS by the USCG and, if used with a later edition of ABS Steel Vessels Rules, changes to this Supplement that result from changes between that later edition and the current edition of ABS Rules must also be applied. The use of this U.S. Supplement is restricted to those vessels which are enrolled in the USCG’s Alternate Compliance Program (ACP) and classed by ABS. The procedures for enrollment in the Alternate Compliance Program are addressed on Page 4 of this Introduction.

Applicability of this Supplement is limited to existing vessels that meet the following conditions and new vessels that are intended to meet the following conditions:

A. A Cargo vessel over 500 gross tons (454 metric tons) ITC or a Passenger vessel carrying 12 or more passengers or an OSV over 500 gross tons (454 metric tons);
B. Greater than 90 meters (295 feet) in scantling length
C. Certificated for international voyage
D. Issued ICLL, SOLAS and MARPOL Certificates
E. Issued and maintains a valid Certificate of Documentation (US Flag)
F. Certified under 46 CFR Subchapter D, H, I, L or U.
G. Classed under ABS Rules for Building and Classing Steel Vessels

The Supplement is divided into twelve sections:

Section I contains supplemental requirements in areas where there exist ABS Rule cites for which the USCG has additional requirements. For ease of reference, each of these cites is identified by the corresponding ABS Rule number. If a Rule cite does not apply to the vessel under consideration, then the associated supplement requirement does not apply.

Section II contains the interpretations of 1974 SOLAS (as amended) from the U.S. Administration for those areas in which the USCG has amplifying or additional requirements. For ease of reference, each of these cites is identified by the corresponding SOLAS cite. If a SOLAS cite is not applicable to the vessel under consideration, then the associated interpretation does not apply.

Section III contains supplemental requirements in areas not contained in the ABS Rules, MARPOL or SOLAS for which the USCG has requirements. For ease of reference, each of these cites is identified by subject area title and an arbitrarily assigned paragraph identifier.

Section IV contains the check sheets to be used both during and after construction (not USCG approved).

Section V contains the check sheet to be used during construction (not USCG approved).

Section VI contains the U.S. Administration’s interpretation of 1974 SOLAS (as amended) for the technical review of passenger vessels. The check sheets for surveys are pending enrollment of a vessel (not USCG approved).

Section VII contains the USCG interpretations for the implementation of the IBC Code.

Section VIII contains the USCG interpretations for the implementation of the IGC Code.

Section IX contains the supplemental requirement for OSV’s > 90 Meters in Length.

Section X contains additional requirements that apply to Subchapter U (Research Vessels).

Section XI contains guidance and references.

Section XII contains the record of revisions commencing after 1 August 1997.

There are specific cites within this document where U.S. domestic standards are specified as mandatory for certain systems, equipment or components. U.S. Federal law is one of the reasons why many items are mandatory. It is recognized that there exist alternative standards developed by regulatory bodies and industry, both internal and external to the United States, which would define systems, equipment or components that are equivalent to those being specified herein. To the extent authorized by USCG Navigation and Vessel Inspection Circular No. 2-95, Change-2
(NVIC 2-95, Change-2), as amended and supplemented, ABS may evaluate alternatives built to these international/industry standards and forward comments and recommendations to the USCG Marine Safety Center (MSC) for final approval. Under no circumstances is ABS authorized to endorse or issue a Certificate of Inspection, exempt international convention requirements, or approve equivalencies to SOLAS or other international conventions.

In the normal course of technological advancement and application, it is entirely possible that new systems, equipment or components will be available for use onboard vessels covered by this program. In the event that existing design requirements are not applicable, it is incumbent on the owner, builder or his designer to seek from ABS as early as possible a determination by the MSC of the requirements which will be applied in such cases.

This document is the result of several years of review by ABS and the USCG. As noted above, the vision was to find common ground in their mutual missions of the protection of life and property at sea.

In August 1994 the USCG delegated authority to ABS under a Pilot Program, as defined in NVIC 2-95, to survey ABS-Classed vessels for compliance with the following statutory instruments:

- The International Convention for the Safety of Life at Sea, 1974 (as amended); and
- The International Convention for the Prevention of Pollution from Ships 73/78.

The Pilot Program was completed on 31 July 1997, and NVIC 2-95 was reissued on 1 August 1997 as NVIC 2-95, Change-1. Incorporated in Change 1 was the Coast Guard delegation of authority for ABS to review plans and conduct surveys on behalf of the USCG for vessels enrolled in the Alternate Compliance Program.

Under ACP, a voluntary program, the owner may elect to have ABS conduct surveys on existing vessels on behalf of the USCG. For new construction, a request is required from both the shipyard and the owner since enrollment in this program will influence both parties.

The controlling documents pertaining to vessels enrolled in ACP are 1974 SOLAS, as amended, MARPOL 73/78, as amended, NVIC 2-95, Change-2 (dated 5 May 2006), Volume II, Section B Chapter 9 of the USCG Marine Safety Manual, the ABS Steel Vessels Rules and this Supplement.

A vessel enrolled in the Alternate Compliance Program must satisfy all the requirements contained in the applicable sections of the International Conventions, ABS Rules and the U.S. Supplement, prior to the issuance of the COI.
PROCEDURES FOR ENROLLMENT AND PARTICIPATION IN ACP

The process for enrollment in ACP is defined in the USCG Marine Safety Manual, Volume II, Section B, Chapter 9 and NVIC 2-95, Change-2 which is the guiding document for ACP administration and policy. The Marine Safety Manual, Volume II, and NVIC 2-95, Change-2 may be accessed, respectively, using the following links:

NEW CONSTRUCTION

For new construction, since the design, fabrication sequences, and construction cost may be affected by the intended enrollment of a proposed new construction in ACP by the owner, it is imperative that the shipyard and owner consult with ABS as early in the design phase as possible. It is prudent to discuss the proposed enrollment in depth as soon as possible to establish the basic fundamentals and administrative clarifications. Upon the completion of such a meeting, both the shipyard and the owner are to forward a written request to ABS to confirm their intentions. For the shipyard, this could be accomplished in concert with the forwarding of the ABS Request for Classification Survey Details (Form A.B.122). For survey purposes, the owner is to forward a separate letter to the local ABS Office or Regional Office (Divisional Assistant Chief Surveyor, ABS Americas) to confirm their intention regarding the enrollment of the vessel. While this will assist in the proper processing within ABS, it is very important to note that the application for enrollment in ACP is to be forwarded to the USCG in accordance with NVIC 2-95, Change-2.

EXISTING VESSELS

With existing vessels, the owner or operator applies for enrollment by submitting an Application for Inspection of U.S. Vessel (Form CG-3752) to the OCMI, indicating their desire to have their vessel participate in the program. The USCG will subsequently authorize the ABS Program Manager (Divisional Assistant Chief Surveyor, ABS Americas) and the local ABS Survey Office to commence the process. A “Hand Over Survey,” discussed later in this text, will be scheduled at a mutually convenient time. Upon completion of this Survey, the owner/operator will receive official notification from the USCG indicating the enrollment status.

RE-FLAGGING

For vessels intending to re-flag to U.S. Flag, it is envisioned that:

1. For existing vessels intended to be certificated under the U.S. flag for the first time, the Supplement will apply in a similar manner to other vessels but with additional requirements or changes.
2. NVIC 10-81 (Current Version) is the guiding document for re-flagging.
3. The USCG accepted Vessel Deficiency Report or “Gap Analysis” augments the definition of the standards applied to the specific vessel.

HOW TO WITHDRAW

In order to withdraw from ACP, the owner is to advise the USCG in writing. If this is agreeable to the USCG, all data applicable to the vessel during the time period the vessel was enrolled in the program will be forwarded to the USCG for incorporation into the USCG computer files.
Upon accomplishment of the information transfer, the owner would then continue the required inspections directly under the jurisdiction of the USCG.

**HAND OVER SURVEY**

For all vessels, a “Hand Over Survey” must take place. The mandatory annual surveys for the SOLAS Cargo Ship Safety Construction Certificate, Safety Equipment Certificate and the MARPOL Certificates are conducted at this time, along with any surveys required for certificates due for renewal or annual classification surveys. The USCG will confirm that the history of the vessel has been properly entered into the ABS Status System. Then the Surveyors and Inspectors will agree on the resolution of any 835s and outstanding requirements. At this time, the USCG will also confirm to the Surveyors that the vessel is in compliance with all CFRs or will advise on those areas that must be corrected. The Surveyor and the Inspector will then complete the ABS Record of Safety Equipment. This record will ensure that the requirements of the USCG continue. The Record of Safety Equipment is to be a permanent part of the vessel’s documents.

**WHAT HAPPENS WITH THE CERTIFICATE OF INSPECTION?**

An ACP vessel will still have a Certificate of Inspection on board. However, it will be distinctively different in that it will not contain details of life-saving appliances and fire-extinguishing equipment. The ABS Status will contain the major details of the vessel.

**WHAT HAPPENS IF THE VESSEL IS DAMAGED?**

It is the responsibility of the vessel’s Master to report a marine casualty or accident, as defined in 46 CFR 4.03 to the cognizant USCG Officer in Charge of Marine Inspection (OCMI). ABS takes the lead in assessing the material condition of the affected vessel, proposing repairs and determining “Fitness to Proceed” and is obliged to share this with the local OCMI. If the vessel poses a pollution threat to the environment or poses a hazard to the safety of a U.S. navigable waterway such as a Class I structural failure, the local OCMI will have final authority to review and approve repairs. This decision must be coordinated with the Surveyor in Charge.

**REPORTABLE CASUALTY**

A marine casualty or accident means a casualty or accident involving any vessel within the navigable waters of the U.S., its territories or possessions, or any casualty or accident involving a US Flag vessel anywhere in the world. This definition of marine casualty or accident does not pertain to public vessels. The situations requiring reporting are contained in 46 CFR 4.05-1, **NOTICE OF MARINE CASUALTY**, as follows:

Immediately after addressing all resultant safety concerns, the owner, agent, master, operator, or person in charge, shall notify the nearest Marine Safety Office or USCG Group Office whenever a vessel is involved in a marine casualty consisting of:

1. An unintended grounding, or an unintended strike of (allision with) a bridge;
2. An intended grounding, or an intended strike of a bridge, that creates a hazard to navigation, the environment, or the safety of a vessel, or that meets any criterion of paragraphs 3 through 7;
3. A loss of main propulsion, primary steering, or any associated component or control that reduces the maneuverability of the vessel;
4. An occurrence materially and adversely affecting the vessel’s seaworthiness or fitness for service or route, including but not limited to fire, flooding, or failure of or damage
to fixed fire-extinguishing systems, life-saving appliances, auxiliary power generating equipment, or bilge pumping systems;

(5) A loss of life;

(6) An injury that requires professional medical treatment (treatment beyond first aid) and, if the person is engaged or employed on board a vessel in commercial service, that renders the individual unfit to perform his or her routine duties; or

(7) An occurrence causing property damage in excess of $25,000 including the cost of labor and materials to restore the property to its condition before the occurrence, but not including the cost of salvage, cleaning, gas-freeing, drydocking, or demurrage.

In addition to the above notification to the USCG, the owner, agent, master, operator or person in charge shall notify the nearest ABS office of any damages, failures, deterioration or repairs to hull, machinery or equipment, which affects or may affect classification or certification, and request an ABS Surveyor to attend the vessel at the first opportunity.

**HOW TO HANDLE THE FORM CG 835**

The Coast Guard may issue deficiencies on form CG-835 in conjunction with its inspections when there is no ABS surveyor onboard or available to attend in which case the Surveyor would normally issue the deficiency. When the CG inspector issues the CG-835, the original will be provided to the vessel’s Master or authorized representative and the Coast Guard inspector will make a copy available to the local ABS office. The local ABS surveyor will enter the Coast Guard deficiency into the ABS vessel’s survey status as an outstanding recommendation when it affects class and statutory certificates, or as a deficiency when it affects only the statutory certificates. The OCMI may accept a report of an ABS surveyor as proof of completion of an outstanding CG-835. The ABS Surveyor will specifically report on clearing of any CG-835 recommendations/deficiencies in a narrative report and forward one copy of the report to the local OCMI to allow USCG records to be updated. Without the written consent of the OCMI, ABS Surveyors cannot extend or modify recommendations/deficiencies that were initially reported on Form CG-835 by Coast Guard Inspectors.

**NO SAIL ITEMS**

This is a term normally used by the USCG when the condition of a vessel is suspect or has deteriorated or has sustained excessive damages such that there is a direct and immediate threat to the vessel’s crew, the safety of navigation or the marine environment. ABS has the same concerns. However, the ABS terminology differs. ABS defines no sail items in various sections of the ABS Process Instructions. ABS does not use the term “Seaworthy.” The term used in ABS is “Fitness to Proceed.” A vessel is not considered Fit to Proceed if it has suffered structural damage that affects the longitudinal strength of the vessel or its watertight integrity. It also applies if the vessel has lost propulsion, steering or electrical generation capacity, including redundant systems.

Any of the foregoing would generate a report of noncompliance with the Rules and be listed as an “Outstanding Recommendation.” Conversely, if the problem lies with SOLAS or MARPOL items, it would be listed as a “Deficiency.” Deficiencies that would prevent a vessel from sailing would be: (1) Loss of life-saving appliances such as lifeboats; (2) Lack of life-saving appliances; (3) Failure of critical parts of the fire-extinguishing system. Examples of “No Sail” items are inoperable fire pumps or depleted fixed fire-extinguishing systems. On occasion an item that is a deficiency will also be an outstanding recommendation against Class. The emergency fire pump
is such an item. The emergency fire pump is required both for Class and for the Safety Equipment Certificate to be issued and/or remain valid.

OUTSTANDING RECOMMENDATIONS (OSR)
This is the term used by ABS to define areas of noncompliance with the Rules. Classification is maintained by a series of Annual Surveys and Periodical Surveys that allow the Class Society an opportunity to survey a vessel and maintain a record of its compliance with the Rules. It also allows ABS to confirm that the owner is maintaining the vessel in a satisfactory condition. A single Outstanding may not necessarily affect the Class of the vessel. Consideration is given to allow time to make corrections or to reach a more appropriate port. A number of Outstanding Recommendations or a major Outstanding Recommendation may be sufficient to question the “fitness of the vessel to proceed.”

WHAT HAPPENS IF THE SPECIAL SURVEYS MUST BE EXTENDED?
ACP survey extensions must be processed through the Survey Manager, ABS Americas. The maximum survey extension will be three months and shall not alter the baseline date for the survey concerned. Except for the Special Surveys, all other surveys have windows of time in which they are to be completed. A series of letters are sent to the owner advising of due dates and overdue dates. Provided there are no special circumstances to consider, the Class of the vessel is in jeopardy and will be canceled 90 days after the due date.

DRYDOCKING EXTENSIONS
Regardless of the circumstances, the USCG retains the ultimate authority for granting drydocking extensions of 90 days or more to ACP vessels. Under exceptional circumstances, ABS allows extensions of drydockings. The vessel must have no record of a grounding since the last drydocking, and a Survey must be conducted. For a 30-day extension, a general examination of the vessel is conducted. For extensions of 31 days up to 90 days, a modified Under Water Survey In Lieu of Drydocking (UWILD) is required. In the modified survey a record of the examination is made on photographs. The diver has a free swim of the bottom. Extensions of 90 days up to one year are normally done to allow the vessel’s surveys to be harmonized with IMO requirements, but must be approved by the USCG. A one-year extension requires a full Under Water Survey in Lieu of Drydocking, including two-way voice and video communications between the Surveyor and the diver. It would be considered unusual to do a one-year extension under any other circumstances.

UNDER WATER SURVEY IN LIEU OF DRYDOCKING
An ACP UWILD guide was developed for vessels enrolled in ACP. Guidance for Underwater Surveys In Lieu of Drydocking for vessels enrolled in the Alternate Compliance Program is included in NVIC 2-95, Change 2, Enclosure (3), which also refers to NVIC 01-89.

DRYDOCKING INSPECTION INTERVALS FOR PASSENGER VESSELS
For passenger vessels on international voyages, the CG has determined that the intervals for drydock inspections will be as specified under 46 CFR 71.50-3(a) which dictates drydocks and internal structural exams be conducted annually. Passenger vessels which have enrolled in the Coast Guard Underwater Survey in Lieu of Drydocking(UWILD) program may undergo drydocks on a twice in five year schedule with annual UWILDs in the intervening years.
For required internal structural exams, all tanks must be inspected annually; however, to accommodate vessel sailing schedules and surveyor availability, the class society may work with the attending Officer in Charge, Marine Inspection to develop a schedule to inspect a percentage of tanks at intervals throughout the year so that all tanks are inspected before the end of that period. At no time shall the period of internal inspection exceed twelve month.

**OVERSIGHT**

The USCG, in delegating surveys to ABS, still retains responsibility that vessels meet regulatory requirements. Crucial to fulfilling this responsibility is active and viable oversight by the USCG.

ABS’ World Wide ISO 9001:2000 Certified Quality System can aid in this oversight. As with any successful quality system, it is a smoothly functioning in-service process verification scheme. It provides a source of continuous and timely opinion related to the effectiveness of the processes in place to meet customer requirements. An added benefit is the information it provides to both clients and management to prove that controlled work is being accomplished. In this respect it is very important in facilitating the delegation to ABS of USCG vessel inspection. It provides a framework that can be used in the USCG oversight program for delegated responsibilities.

Oversight will consist of internal and external audits of ABS by the USCG. It will also consist of annual boardings of the vessels to verify continued compliance with the issued certificates. The boardings will be similar to those done in Port State Inspections. A check sheet describing the considerations to expand the boardings is a part of the USCG Marine Safety Manual, Volume II, Section B Chapter 9. Coast Guard oversight activities also include periodic oversight reexaminations, attendance at dockings, new construction visits, attendance at UWILD surveys, evaluation of plan review activities and attendance at ISM Code safety management system audits.

**Supplemental Reporting**

Certain supplemental information is required by the USCG to satisfy their requirements for the renewal and maintenance of the Certificate of Inspection. This supplemental information is indicated on Check Sheets ACP CS, ACP ES, ACP SS, and ACP NCS. These check sheets can be found in Section IV and V of this supplement and are to be completed with the standard ABS check sheet described on the Check Sheet.

With regards to U.S. flagged passenger vessels requiring Safety Passenger Certificates, ABS is not authorized under ACP to issue the SOLAS Passenger Ship Safety Certificate. (SLP) Although ABS will not issue the SLP certificate, ABS at the request of the owners and USCG will carry out the applicable Safety Passenger Ship Survey and issue a report in the normal manner to the vessel’s owners. A copy of the report should be left onboard. The USCG may take into consideration this report in the course of their inspections for issuance of the SLP certificate. Where the owners have asked ABS to conduct these surveys, the attending Surveyor is to confirm to the Survey Department so that a comment may be added to the vessel status.

I. SUPPLEMENTAL REQUIREMENTS TO CURRENT ABS RULES

Cite: 1-1-5/1 Other Regulations – General

Cargo Gear is to be certified in accordance with the ABS “Requirements for Certification of Construction and Survey of Cargo Gear on Merchant Vessels”, 1975 or the Guide for Certification of Cranes, 1991 as applicable for the type of cargo gear being provided.

As an alternative, evidence of approval by the International Cargo Gear Bureau may be submitted.

Cite: 3-3-1/3.1 Intact Stability

Intact stability for cargo and passenger vessels is to comply with the applicable parts of Subchapter S. It has been determined that IMO Resolution MSC.267 (85), “International Code on Intact Stability, 2008” (2008 IS Code) is equivalent to the intact stability requirements of Subchapter S. Where the intact stability requirements contained in IMO Resolution MSC.267 (85) are used, the Regulations contained in Subparts B, Lifting, and E, Towing, of Subchapter S are also to be satisfied, where applicable. All recommendations that appear in the 2008 IS Code on Intact Stability are required and considered mandatory.

Cite: 3-3-1/3.3 Damage Stability

Relative to damage stability, please note that all dry cargo vessels over 80 meters (262.5 ft) in length that change flag to US shall be considered to be new vessels for compliance with the probabilistic damage stability regulations in SOLAS, 1974, as amended, Chapter II-1, regardless of the actual build date.

Cite: 4-3-4/13 Steering Gear – Control Systems

The main steering gear is to be provided with full follow-up control in the pilothouse. Follow-up control means closed-loop (feedback) control that relates the position of the helm to a specific rudder angle by transmitting the helm-angle order to the power actuating system and, by means of feedback, automatically stopping the rudder when the angle selected by the helm is reached.

Cite: 4-3-4/15 Steering Gear – Instrumentation and Alarms

This requirement applies to each vessel of 1600 gross tons and over that has power driven main or auxiliary steering gear. The steering failure alarm system must be independent of each steering gear control system, except for the input received from the steering wheel shaft.

The steering failure alarm system must have audible and visible alarms in the pilothouse when the actual position of the rudder differs by more than 5° from the rudder position ordered by the follow-up control systems for more than:

(a) 30 seconds for ordered rudder position changes of 70°,
(b) 6.5 seconds for ordered rudder position changes of 5°, and

(c) The time period calculated by the following formula for ordered rudder position changes between 5° and 70°:

\[ t = \frac{R}{2.76} + 4.64 \]

Where:
- \( t \) = maximum time delay in seconds
- \( R \) = ordered rudder change in degrees (°)

Each steering failure alarm system must be supplied by a circuit that is independent of other steering gear systems and steering alarm circuits.

Cite: 4-4-1/1 Boilers and Pressure Vessels and Heat Exchangers

Boilers, pressure vessels and heat exchangers are to comply with the requirements specified in 4-4-1 of the 2011 ABS Steel Vessels Rules or the ASME Code. Boilers, pressure vessels and heat exchangers manufactured to any other standard will be considered on a case-by-case basis in coordination with the Marine Safety Center.

Cite: 4-6-2/5.11 Piping Systems – Metallic Piping – Valves

A valve in which the closure is accomplished by resilient nonmetallic material instead of a metal to metal seat shall comply with the design, material and construction specified below. Valves employing resilient material shall be divided into three categories; Positive shutoff, Category A and Category B and shall be tested and used as follows:

- **Positive Shutoff Valves** – The closed valve must pass less than 10 ml/hr (0.34 fluid oz/hr) of liquid or 3 liters/hr (0.11 ft³/hr) of gas per inch nominal pipe size through the line after removal of all resilient material and testing at full rated pressure. Packing material must be fire resistant. Piping subject to internal head pressure from a tank containing oil (fuel, lube and cargo) must be fitted with a positive shutoff valve at the tank. See 4-6-4/13.5.3 of the Rules for additional requirements for such valves. Positive shutoff valves may also be used in any location in lieu of a required Category A or Category B valve.

- **Category A Valves** – The closed valve must pass less than the greater of 5% of its fully open flow rate or 15% / \sqrt{NPS} of its fully open flow rate through the line after removal of all resilient material and testing at full rated pressure. Category A valves may be used in any piping system except where positive shutoff valves are required. Category A valves are required in the following locations:

  - Valves at vital piping (Fuel, Fire Main, CO2, Halon, Bilge, Steering, Propulsion and its necessary auxiliaries, Ship’s Service and Emergency Electrical Generation) system manifolds;
- Isolation valves in cross-connects between two piping systems, at least one of which is a vital system, where failure of the valve in a fire would prevent the vital system(s) from functioning as designed;
- Valves providing closure for any opening in the shell of the vessel.

- Category B Valves – The closed valve will not provide effective closure of the line or will permit appreciable leakage from the valve after the resilient material is damaged or destroyed. Category B valves are not required to be tested and may be used in any location except where a Category A or Positive shutoff valve is required.

If a valve designer elects to use either calculations or actual fire testing in lieu of material removal and pressure testing, the proposed calculation method or test plan must be accepted by the Commandant.

Cite: 4-6-3 Piping Systems – Plastic Piping

Pipes and piping components made of thermoplastic or thermosetting plastic materials, with or without reinforcement, are to conform to IMO Res. A.753(18). Piping required to meet flame, fire endurance, and/or smoke generation/toxicity requirements of A.753(18) must be USCG type approved. In lieu of meeting the smoke and toxicity requirements of A.753(18), plastic pipe located in concealed areas of an accommodation, control or service space must meet one of the following:
(1) The trunk or duct containing the plastic pipe must be surrounded by an “A” class division; or (2) the concealed space containing the pipe must be fitted with approved smoke detection and penetrations of a bulkhead or deck and each draft stop installation shall maintain integrity of the fire divisions.

Cite: 4-7-3/1 Fire Safety Systems – Fire-Extinguishing Systems and Equipment – Fire Mains

Fire mains may not be used for other than fire, deck wash or tank cleaning services unless specific provisions are included in the system design which ensure that system availability and performance requirements to fight shipboard fires are not compromised.

All distribution valves in the fire main system shall be distinctly marked to indicate the compartments or parts of the vessel to which they lead.

Material selection for piping and components shall be in accordance with 46 CFR 56.60 or ASTM F1155. Brass or bronze materials may be used in accordance with these standards.

USCG acceptable category “A” valves may be used in fire main systems.

Cite: 4-8-2/3.11 Electrical Systems – System Design – System Arrangement

Time for starting and connection to the main switchboard must be both not more than 30 seconds and less than the time to start and connect the emergency generator to the emergency switchboard.
A stop control for an emergency generator must only be in the space that has the emergency generator, except a remote mechanical reach rod is permitted for the fuel oil shutoff valve to an independent fuel oil tank located in the space.

Each bus-tie between a main switchboard and an emergency switchboard must be arranged to prevent parallel operation of the emergency power source with any other source of electric power, except for interlock systems for momentary transfer of loads.

If there is a reduction of potential of the normal source by 15% to 40%, the final emergency power source must start automatically without load. When the potential of the final emergency source reaches 85% to 95% of normal value, the emergency loads must transfer automatically to the final emergency power source. When the potential from the normal source has been restored, the emergency loads must be manually or automatically transferred to the normal source, and the final emergency power source must be manually or automatically stopped.

Three means of shutdowns are required: low L.O. Pressure, Overspeed and upon release of the Fixed Fire-Extinguishing System in the Emergency generator room.

MCC and Lighting cables are not permitted a decrease in size if interlocks are employed.

Each navigation light must meet the following:

(a) Meet the technical details of the applicable navigation rules.

(b) Be certified by an independent laboratory to the requirements of UL 1104 or an equivalent standard.

(c) Be labeled with a label stating the following:

   (1) “MEETS ________________” (Insert the identification name or number of the standard under paragraph (b) above to which the light was tested.)

   (2) “TESTED BY ________________” (Insert the name or registered certification mark of the independent laboratory that tested the fixture to the standard under paragraph (b) above.)
Means of communications are to be provided between the navigation bridge and the engineer officer's accommodation for vessels with minimally attended or periodically unattended machinery spaces.

The voice communication system power supply must ensure sufficient redundancy and capacity to be considered able to operate independent of the vessel's electrical system in which the loss of any one system component will not disable the rest of the system.

On a vessel with more than one propulsion engine, each engine must have an engine order telegraph. On a double-ended vessel that has two navigating bridges, this system must be between the engine room and each navigating bridge.

On vessels equipped with pilothouse control, each local control station in the engine room must have an indicator if the local control station is not immediately adjacent to the engine room control station.

Engine order telegraph and remote propulsion control systems must be electrically separate and independent, except that a single mechanical operator control device with separate transmitters and connections for each system may be used.

Each vessel with navigating bridge throttle control must have a positive mechanical stop on each telegraph transmitter that prevents movement to the “Navigating Bridge Control” position without positive action by the operator.

**Electric Engine Order Telegraph System**

Where two or more transmitters, located on or on top of, or on the wings of, the navigating bridge operate a common indicator in the engine room, all transmitter handles and pointers must operate in synchronism or operate under the control of a transmitter transfer control as described below. Where the transmitters are mechanically interlocked to effect synchronous operation, a failure of a wire or chain at any transmitter must not interrupt or disable any other transmitter.
• Transmitter Transfer Control System: Except for a transmitter in an unattended navigating bridge on a double-ended vessel, each transmitter must operate under the control of a transmitter transfer control so that movement of any one transmitter handle automatically connects that transmitter electrically to the engine room indicator and simultaneously disconnects electrically all other transmitters. The reply pointers of all transmitters must operate in synchronism at all times.

On a double-ended vessel that has two navigating bridges, a manually operated transfer switch which will disconnect the system in the unattended navigating bridge must be provided.

Each electric engine order telegraph system must have transmitters and indicators that are electrically connected to each other.

Each engine room indicator must be capable of acknowledgment of orders.

Each system must have an alarm on the navigating bridge that automatically sounds and visually signals a loss of power to the system. The alarm is to be provided with means to reduce the audible signal from 100% to not less than 50%.

**Mechanical Engine Order Telegraph System**

Each mechanical engine order telegraph system must consist of transmitters and indicators mechanically connected to each other.

Each transmitter and each indicator must have an audible signal device to indicate, in the case of an indicator, the receipt of an order, and in the case of a transmitter, the acknowledgment of an order. The audible signal device must not be dependent upon any source of power for operation other than that of the movement of the transmitter or indicator handle.

If more than one transmitter operates a common indicator in the engine room, all transmitters must be mechanically interlocked and operate in synchronism. Where the transmitters are mechanically interlocked to effect synchronous operation, a failure of a wire or chain at any transmitter must not interrupt or disable any other transmitter.

---

**Cite: 4-8-2/11.5.3 Electrical Systems – Interior Communication**

A sound-powered telephone system or other reliable voice communication method must be installed that is independent of the vessel's electrical system (Ref: 46 CRF 113.30-3(b)).

---

**Cite: 4-8-2/9.17.5 Electrical Systems – Electrical Design – Protection of Steering Gear Motor Circuits**

(a) AC Steering Gear motors. The steering gear feeder must be provided with instantaneous trip protection (no overload protection allowed)
Cite: 4-8-3/5.5.4 Electrical Systems – Electrical Equipment – Emergency Switchboards – Instrumentation

Each AC switchboard must have a voltage regulator functional cut-out switch for transferring from automatic to manual control mode and a manual control rheostat for exciter field. This is not applicable if the exited current for the emergency generator is provided by attached rotating exciters or by static exciters deriving their source of power from the machines controlled.

A static exciter is prohibited by 46 CFR 111.12-3 for the emergency generator, unless the generator is provided with a permanent magnet or residual magnetism type exciter that has the capability of voltage build-up after two month of no operation.

Cite: 4-8-3/9.1 Electrical Systems – Electrical Equipment - Cables

IEC 60092-3, IEC 60092-350 and IEC 60072-353 are acceptable cable constructions standards to be used.

For electric cables in hazardous areas, the electric cable construction and the cable glands are to achieve the appropriate seal so that gas cannot migrate or pass through the cable.

Cite: 4-8-3/13 Electrical Systems – Electrical Equipment – Certified Safe Equipment – 4-8-4/27.5 Certificated Safe Equipment in Hazardous Areas

IEC certificated safe equipment must be tested or approved under the IECEx scheme and certification body must be recognized by the Commandant (i.e., certification under the ATEX scheme is not acceptable). See Section II/Cite: II-1/45.

Intrinsically safe systems or associated apparatus must meet the following “Ex ia” for Zones 0 and 1 (Class I, Division 1); and “Ex ib” for Zone 2 (Class I, Division 2).

Cite: 4-8-4/21.1.6 Electrical Systems – Shipboard Installation and Tests – Paint Cables

Painting of cables is not permitted.

Cite: 4-9-1/7 Remote Propulsion Control and Automation – General – Required Plans and Data

The degree of remote propulsion control and automation is to be based on the level of manning intended for the propulsion machinery space. Where it is intended to obtain USCG certification for a minimally attended machinery space, the ABS ACC requirements as well as the additional Cites contained in this Supplement are applicable.

Where it is intended to obtain USCG certification for an unattended machinery space, the ABS ACCU requirements as well as the additional Cites contained in this Supplement are applicable.
Note: It is the Owner’s responsibility to advise ABS as to the level of manning of the propulsion machinery space that will requested from the USCG.

One copy of a qualitative failure analysis must be submitted for propulsion controls, microprocessor-based system hardware, safety controls, automated electric power management, automation required to be independent that is not physically separate and any other automation that in the judgment of the reviewing authority potentially constitutes a safety hazard to the vessel or personnel in case of failure. The QFA should enable the designer to eliminate single points of failure.

Note: The qualitative failure analysis is intended to assist in evaluating the safety and reliability of the design. It should be conducted to a level of detail necessary to demonstrate compliance with applicable requirements and should follow standard qualitative analysis procedures. Assumptions, operating conditions considered, failures considered, cause and effect relationships, how failures are detected by the crew, alternatives available to the crew, and necessary design verification tests should be included. Questions regarding failure analysis should be referred to the reviewing authority at an early stage of design.

A Design Verification test is to be performed once, immediately after the installation of the automated equipment or before issuance of the initial Certificate of Inspection (and thereafter whenever major changes are made to the system or its software), to verify that automated systems are designed, constructed and operate in accordance with the applicable ABS rules and requirements of this supplement. The purpose of design verification testing is to verify the conclusions of the QFA. The Design Verification Test Procedure (DVTP) is therefore an extension of the QFA and the two may be combined into one document. The DVTP should demonstrate that all system failures are alarmed and that all switchovers from a primary system component to a back-up component are also alarmed.

Periodic Safety tests must be conducted annually to demonstrate the proper operation of the primary and alternate controls, alarms, power sources, transfer override arrangements, interlocks and safety controls. Systems addressed must include fire detection and extinguishing, flooding safety, propulsion, maneuvering, electric power generation and distribution and emergency internal communications. Table 1 of Section 4-9-2 of ABS SVR, Table 2 of 4-9-3 and Tables 3 through 8 of 4-9-4, as applicable to the vessel’s installed machinery and level of manning, should be used as a guide in developing the Periodic Safety Test Procedure (PSTP).

Design Verification and Periodic Safety test procedures are to be submitted for approval and retained aboard the vessel. Test procedure documents must be in a step-by-step or check off list format. Each test instruction must specify equipment status, apparatus necessary to perform the tests, safety precautions, safety control and alarm set points, the procedure to the followed, and the expected test result. Test techniques must not simulate monitored system conditions by maladjustment, artificial signals, improper wiring, tampering, or revision of the system unless the test would damage equipment or endanger personnel. Where a test meeting the restrictions on test techniques will damage equipment or endanger personnel, an alternative test method shall be proposed together with an explanation of why it is an equivalent test.

It is important to remember that the DVTP tests the response of the automation system to component failures within the system as predicted by the QFA and that the PSTP tests the
performance of the automation system, its sensors, alarms, and actuators, and the interconnecting wiring. The design verification and periodic safety tests are to be witnessed by the surveyor. The OCMI must be notified prior to testing and may choose to attend these tests to verify that vital system automation is appropriate to the level of manning requested on the vessel’s Certificate of Inspection.

Vessels with minimally attended or periodically unattended machinery plants must have a planned maintenance program to ensure continued safe operation of all vital systems. The program must include maintenance and repair manuals for work to be accomplished by maintenance personnel and check off lists for routine inspection and maintenance procedures.

The planned maintenance program must be functioning prior to the completion of the evaluation period for reduced manning.

Maintenance and repair manuals must include details as to what, when and how to troubleshoot, repair and test the installed equipment and what parts are necessary to accomplish the procedures. Schematic and logic diagrams must be included in this documentation. Manuals must clearly delineate information that is not applicable to the installed equipment.

A set of Coast Guard approved automation testing procedures shall be maintained on board and made available upon request.

Cite: 4-9-1/5.1.10 Remote Propulsion Control and Automation – General – & 4-9-1/9.9 Safety Systems

Safety systems must not operate as a result of failure of the normal electric power source unless it is determined to be the failsafe state.

Sensors for the primary speed, pitch or direction of rotation control in closed loop propulsion control systems must be independent and physically separate from required safety, alarm or instrumentation sensors.

Cite: 4-9-2/5 Remote Propulsion Control and Automation – Remote Propulsion Control – Control on Navigation Bridge

An alarm to indicate starting capability of less than 50% of the requirement total starting capacity must be provided.

Cite: 4-9-3/1 Remote Propulsion Control and Automation – ACC – Application

Propulsion control from the Navigating Bridge is to be provided.
A personnel alarm must be provided and must annunciate on the Navigating Bridge if not routinely acknowledged at the centralized control station or in the machinery space.

All required alarms must annunciate throughout the Centralized Control Station and the machinery space.

The standby electric power is to be available in no more than 30 seconds.

The fire detection and alarm system of approved type must activate all alarms at the Centralized Control Station, the Navigating Bridge, and throughout the machinery spaces and engineer’s accommodations.

The Centralized Control Station must include control of the main machinery space fire pumps. Where one or more fire pumps is required to be independent of the main machinery space, at least one of such pumps must be controlled from the Navigating Bridge. See Section II/Cite II-2/7.2

All required fire pump control locations must include the controls necessary to charge the fire main and have (1) a fire main pressure indicator or (2) a fire main low pressure alarm.

Pressure vacuum relief valves and high velocity vent valves installed on tank vessels must be USCG approved equipment.
Cite: 5C-1-7/3.3  Specific Vessel Types – Vessels Intended to Carry Oil in Bulk – Cargo Oil System

The provisions in 5C-1-7/3.3.4(a) of the Rules, which permit the unrestricted routing of cargo piping through ballast tanks for vessels less than 5000 tons deadweight, is not acceptable on U.S. flagged vessels.

The requirements of 4-6-4/13.5.3 of the Rules for positive closing valves to be fitted on pipes emanating from fuel oil tanks which are subject to a static head of oil are also applicable to pipes from cargo oil tanks which are subject to a static head of oil.

Cite: 5C-1-7/5.3  Specific Vessel Types – Vessels Intended to Carry Oil in Bulk – Ballast System

The provisions in 5C-1-7/5.3.2(a) of the Rules, which permit the unrestricted routing of ballast piping through cargo tanks for vessels less than 5000 tons deadweight, is not acceptable on U.S. flagged vessels.

Cite: 5C-1-7/9  Specific Vessel Types – Vessels Intended to Carry Oil in Bulk – Cargo Heating Systems

A thermal fluid heater must be fitted with a control which prevents the heat transfer fluid from being heated above its flash point.

Cite: 5C-1-7/21  Specific Vessel Types – Vessels Intended to Carry Oil in Bulk – Cargo Vapor Emission Control Systems

In addition to meeting the requirements 5C-1-7/21 for Cargo Vapor Emission Control Systems:

(a) Personnel training should be verified.

(b) Connections on hoses and manifolds must be properly marked with a yellow band 0.8 m (2.64 ft) long between two red bands 0.1 m (.33 ft) long with the word “VAPOR” in black letters at least 50 mm (2 in) high on the yellow band.

Note: Oil Companies International Marine Forum Recommendation for Oil Tanker Manifolds and Associated Equipment, 4th Ed., has an alternative marking arrangement for vessel manifolds that is acceptable. The difference is that reducers on manifolds, where they are used, are lettered (at 2 and 10 o’clock) with the word “vapor”. That word does not need to be painted on the last meter of pipe that is before the flange.

(c) Manifold flanges should have a stud and the hose/loading arm flange should have a hole.

(d) Markings for overfill protection outside the control room should be in 50 mm (2 in) high black letters on a white background.
Each cargo tank shall have arrangements that allow oxygen measurements to be taken at a point 1m (3.3 ft) below the tank top and from a point at half the ullage prior to cargo transfer when cargo vapor is collected by a facility that requires the vapor from the vessel to be inerted, or when cargo vapor is transferred between vessels during lightering or topping off operations with vapor balancing.

II. SOLAS INTERPRETATIONS NOT ADDRESSED BY ABS RULES

General

Equipment Approvals
Approvals of safety equipment, materials and installations are covered by regulations contained in 46 CFR 2.75. For U.S. flag vessels, specific and type approvals for fire suppression equipment, structural fire protection materials and life-saving appliances are performed by the USCG as mandated by SOLAS 1974, generally through independent laboratory testing and inspection. Provisions within the 1996 USCG Authorization Act also allow the use of equipment approved by or on behalf of other governments under certain circumstances. In the case of life-saving appliances, there must be a reciprocal agreement in place before equipment approved by that country could be used on a U.S. vessel. ACP does not change the requirements to use USCG approved materials and equipment. Therefore, class society approvals cannot be used to fulfill the obligations of the USCG, as an Administration, where type approval is required by the regulations.

The USCG approves applicable “SOLAS” lifesaving equipment using the IMO LSA Code. For fire protection items, the USCG approves “SOLAS” materials using the IMO Fire Test Procedures Code and the IMO Fire Safety Systems Code.

Mutual Recognition Agreement (MRA) exists between the U.S. and the European Community (EC), and the U.S. and the European Free Trade Association (EFTA), which address a limited number of items of fire protection, lifesaving, and navigation equipment. The MRA makes it possible for a manufacturer with a European Approval (MED/wheelmark) to obtain USCG approval for certain equipment covered by the MRA. This is accomplished by permitting the “Notified Bodies” responsible for issuing approvals in Europe to issue USCG approval. Likewise, the USCG is able to issue the European Approval (MED/wheelmark) for manufacturers having a USCG approval if the item is included within the scope of the MRA. It is important to note that this MRA does not change the requirement of using USCG approved equipment and materials on U.S. Flag vessels. It allows an alternative means for obtaining USCG approval. The European Marine Equipment Directive (MED) “wheelmark” is not accepted in lieu of USCG approval. Further guidance is contained in NVIC 8-04 and NVIC 8-04 Change 1.

Fire Equipment and Arrangements
USCG type-approved materials and equipment from both U.S. and foreign sources approved in accordance with the procedures contained in 46 CFR 159 will continue to be acceptable, and those items manufactured in a country with which the United States has a Mutual Recognition Agreement in force or the USCG has found to have an equivalent approval program will also be acceptable.

As discussed above, the following structural fire protection materials approved by the MRA may be used in lieu of USCG type approved materials for ACP vessels.

*For detail USCG Approval Process for the above-listed equipment please refer to NVIC 8-01.
A. Construction – Subdivision and Stability, Machinery and Electrical Installations

Cite: II-1/43 Emergency Source of Electrical Power in Cargo Ships

There must be visible indicators in the machinery space to show when the automatically controlled emergency power source is supplying the emergency loads.

Cite: II-1/45 Precautions Against Shock, Fire and Other Hazards of Electrical Origin

“Standards not inferior to those acceptable to the Organization” means standards contained in only one of the following sources:

(a) Part 5, Chapter 1, Section 7 “Cargo Oil and Associated Systems,” 31 “Electrical Installations” of the 2006 edition of ABS Rules for Building and Classing Steel Vessels. (Note: The reference to SOLAS regulation II-2/56 should instead be made to SOLAS regulation II-2/4.5 and II-2/9.2.4.2.5);

(b) The requirements of 46 CFR 111.105; or

(c) IEC 60092-502: 1999 “Electrical installations in ships – tankers” as supplemented by interpretations and additional requirements of IEC 60092-502: 1999 issued by the U.S. Coast Guard in April 2009.

(d) Any U.S. flagged OSV that operates seaward of the boundary line and that is certified to carry hazardous or NLS cargoes must comply with CG-522 Policy Letter 09-01 “POLICY ON THE IMPLEMENTATION OF RESOLUTION A.673(16) FOR U.S. OFFSHORE SUPPLY VESSELS” (as amended).

B. Construction – Fire Protection, Fire Detection and Fire Extinction

Cite: II-2/3.1 Definitions – Accommodation Spaces

“A pantry containing no cooking appliances” is one which contains only low heat warming equipment, has steel furnishings and is not used as a storeroom for cleaning gear, linen supplies or any other combustible material. A dining room containing such appliances shall not be regarded as a pantry.

Cite: II-2/4.2.2.5.1 Fuel Oil Piping

The use of heat sensitive materials is prohibited in piping systems conveying flammable or combustible products. Heat sensitive materials are those having a solidus melting point below 1700° F.

Cite: II-2/10.2.1.1 Fire Main and Hydrants

Material Selection for piping and components shall be in accordance with 46 CFR 56.60 or ASTM F1155. Brass or bronze materials may be used in accordance with these standards.
Valves employing resilient material may be used in firemain systems provided they are USCG acceptable Category “A” or positive shutoff valves per 46 CFR 56.20-15.

Cite:  II-2/7.2  Fixed Fire Detection and Fire Alarm Systems
FSS Code
Chapter 9

Fire protection systems must be USCG approved equipment.

A conductor must not be used as a common return from more than one zone.

Each connection box must be constructed in accordance with NEMA 250 Type 4 or 4X, or IEC IP56 requirements (46 CFR 113.10-7).

There must be at least two sources of power for the electrical equipment of each fire detecting and alarm system. The normal source must be the main power source. The other source must be the emergency power source or an automatically charged battery. If the other source is an automatically charged battery, the charger must be supplied from the emergency power source. Upon loss of power to the system from the normal source, the system must be automatically supplied from the other source.

The capacity of each branch circuit providing power to a fire detection or alarm system must not be less than 125 percent of the maximum load.

An alarm on one fire detection circuit shall not interfere with the normal operation of any other circuit (46 CFR Part 161.002).

Each fire detecting zone must not include spaces on more than one deck, except:

(a) Adjacent and communicating spaces on different decks in the ends of the vessel having a combined ceiling area of not more than 279 m² (3000 ft²).
(b) Isolated rooms or lockers in such spaces as mast houses, wheelhouse top, etc., which are easily communicable with the area of the fire-detecting circuit to which they are connected.
(c) Systems with indicators for individual spaces.

The fire detecting zone must not contain more than 50 protected rooms or spaces.

The system must visually indicate the zone in which the alarm originated.

The detectors, control panel, manual call points and alarms must be listed in the approved component list for the USCG approved system.

The fire detecting system must be used for no other purpose, except it may be incorporated with the manual alarm system.
A framed chart or diagram must be installed in the wheelhouse or control station adjacent to the detecting cabinet indicating the location of the detecting zones and giving operating instructions.

Cite: II-2/7.4 Fixed Fire Detection and Fire Alarm Systems – Protection of Machinery Spaces

The fire control station must include an indicating unit or a fire alarm annunciator that indicates the machinery space that is on fire.

Cite: II-2/7.2 & FSS Code Chapter 9.2.4 Fixed Fire Detection and Fire Alarm Systems – Installation Requirements

A sufficient number of call points must be employed such that a person escaping from any space would find an alarm box convenient on the normal route of escape.

The manual alarm system must be used for no other purpose, except it may be incorporated with the fire detecting system.

Manual fire alarm boxes shall be clearly and permanently marked “IN CASE OF FIRE BREAK GLASS” in at least 12.5 mm (½ in) letters.

Detector spacing shall be in accordance with the manufacturer’s recommendation. Detector spacing in spaces with ceilings greater than 3 m (10 ft) must be corrected in accordance with NFPA 72E.

Cite: II-2/9.2.3.1 Structural Fire Protection – Method of Protection in Accommodation Area

Only Method IC shall be used.

Cite: II-2/9.2.3.3 Fire Integrity of Bulkheads and Deck

In accordance with 46 CFR 112.05-5(e) or 127.220, no compartment that has an emergency power source or its vital components may adjoin a Category A machinery space or those spaces containing the main source of electrical power and its vital components.

Cite: II-2/9.3.1 “A” Class Divisions Penetrations

Non-ducted ventilation arrangements are to comply with the guidance provided in NVIC 9-97, CH 1.

Cite: II-2/9.7.3 Duct Penetrations

A large duct may not be subdivided into multiple smaller ducts when passing through a fire boundary to avoid the requirement to install automatic fire dampers.
At each fire hose valve there shall be marked in not less than 50 mm (2 in) red letters and figure: “FIRE STATION.”

Each section of fire hose shall be lined commercial fire hose that conforms to Underwriters’ Laboratories, Inc. Standard 19 or Federal Specification ZZ-H-451E.

The minimum hydrant and hose size shall be 40 mm (1.5 in.).

On passenger and cargo ships over 1500 gross tons, the minimum hydrant and hose size for interior and exterior locations is 65 mm (2.5 in.). For interior locations, where 65 mm (2.5 in) hydrants and hose are required, two 40 mm (1.5 in) outlets with two 40 mm, (1.5 in) hoses supplied through a siamese connection may be substituted.

On tankships over 125 m (400 ft (L.O.A.)), the minimum hydrant and hose size for exterior locations is 65 mm (2.5 in.). Where 65 mm (2.5 in) hydrants and hose are required, two 40 mm (1.5 in) outlets with two 40 mm, (1.5 in) hoses supplied through a Siamese connection may be substituted. Please note that two hoses are required at exterior fire stations equipped with Siamese fittings.

Where two 40 mm (1.5 in) hydrants and hoses are permitted in lieu of one 65 mm (2.5 in) hydrant and hose, both of the outlets operating simultaneously are to be considered as a single outlet for the purpose of complying with the minimum number of jets criteria for fire pump capacity.

Nozzles must be USCG approved equipment.

Fire extinguishers must be USCG type-approved equipment.
Carbon dioxide and clean agent systems, such as FM200, NOVEC 1230, Halon or Halon substitutes, etc., are to be USCG Type Approved. The design and installation must be in accordance with the USCG Type Approved manufacturer’s manual. Where SOLAS and the USCG Type Approved manufacturer’s manual have dissimilar requirements (such as agent required calculations) the higher standard is to be satisfied.

Markings

CO₂ fire smothering apparatus shall be marked “CO₂ FIRE APPARATUS” in not less than 50 mm (2 in) red letters.

Water mist system requirements are outlined in IMO MSC/Circ.1165 for machinery spaces and IMO Resolution A.800(19) for accommodation and service spaces. These guidelines are used in conjunction with USCG Type Approved Manuals. Water spray system requirements are in FSS Chapter 7.

A fixed pressure water-spraying, fire extinguishing system is not acceptable by the USCG except for lamp lockers, paint lockers and pump rooms. Where installed in these spaces, it shall comply with Chapter 7 of the FSS Code and the following:

Water mist system requirements are outlined in IMO MSC/Circ.1165 for machinery spaces and IMO Resolution A.800(19) for accommodation and service spaces. These guidelines are used in conjunction with USCG Type Approved Manuals

Automatic sprinkler systems are also to comply with National Fire Protection Association (NFPA) Standard 13-1996. Where SOLAS Reg. II-2/12 and NFPA Std. 13 have similar requirements, the higher standard is to be satisfied. The following supplemental requirements apply:

The sprinkler heads, alarms, dry pipe valves, and actuating mechanisms shall be listed or approved by a recognized independent testing lab.
The control the minimum design area required by SOLAS is (280 m²) 3,013 ft² cabinets or spaces containing valves or manifolds shall be distinctly marked in conspicuous red letters at least 50 mm (2 in) high “AUTOMATIC SPRINKLING SYSTEM.”

Cite: II-2/10.3 Storage of Fireman’s Outfits

Lockers or spaces where emergency equipment is stowed shall be marked: “EMERGENCY EQUIPMENT”.

Cite: II-2/13 Means of Escape

The doors giving access to either of the two required means of escape shall not be lockable, except that crash doors or locking devices, capable of being easily forced in an emergency, may be employed provided that a permanent and conspicuous notice giving instructions on how to open the door or the lock is attached to both sides of the door. This paragraph shall not apply to outside doors to deckhouses where such doors are locked by key only, and such key is under control of one of the vessel’s officers.

All public spaces having a deck area of over 28 m² (300 ft²) shall have at least two exits. Where practicable, the exits shall give egress to different corridors, spaces, or rooms to minimize the possibility of one incident blocking both means of escape.

All interior stairways, other than those within the Machinery Spaces or Cargo Holds, shall have a minimum width of 0.71 m (28 in.). The angle of inclination with the horizontal of such stairways shall not exceed 50°.

Cite: II-2/13 Miscellaneous Items

Small rooms or spaces having a secondary means of escape which is not obviously apparent shall have a suitable sign in red letters “EMERGENCY EXIT” directing attention to such escape.

C. Life-Saving Appliances and Arrangements (This supplement entry is intended to add clarity to the various terms used but not clearly defined in SOLAS.)

Cite: III/3 Definitions

“Accommodation” means a cabin or other covered or enclosed place intended to carry persons. Each place where passengers are carried is considered an accommodation, whether or not it is covered or enclosed. Accommodations include, but are not limited to halls, dining rooms, mess rooms, lounges, corridors, lavatories, cabins, offices, hospitals, cinemas, game and hobby rooms, and other similar spaces open to persons on board.

“Embarkation station” means the place where a survival craft is boarded.
“Fleet angle for a wire rope leading to a winch drum” means the angle included between an imaginary line from the lead sheave perpendicular to the axis of the drum and the line formed by the wire rope when led from the lead sheave to either extremity of the drum.

“Marine evacuation system” means an appliance designed to rapidly transfer large numbers of persons from an embarkation station by means of a passage to a floating platform for subsequent embarkation into associated survival craft, or directly into associated survival craft.

“Muster station” means the place where the crew and passengers assemble before boarding a survival craft.

“Seagoing condition” means the operating condition of the ship with the personnel, equipment, fluids and ballast necessary for safe operation on the waters where the ship operates. For bottom-bearing mobile offshore drilling units, the term also applies in the bottom-bearing mode, but the “lightest seagoing condition” is considered to be the highest anticipated operating condition.

“Survival craft” means a craft capable of sustaining the lives of persons in distress after abandoning the ship on which they were carried. The term includes lifeboats, liferafts, buoyant apparatus, and life floats, but does not include rescue boats.

Cite: III/4 Evaluation, Testing and Approval of Life-Saving Appliances and Arrangements

Life-saving appliances must be approved to the appropriate CFR, SOLAS or IMO standard. USCG approved products and systems are accepted regardless of country of manufacture. The USCG recognizes that with the Life-saving Appliances Code (LSA Code) there exists an acceptable IMO standard for approval.

Equipment carrying a CG approval number issued under the US-EC or US-EFTA Mutual Recognition Agreements, discussed above the “General” section, are acceptable.

A copy of the USCG acceptance letter must be provided with each piece of equipment supplied to a U.S. flag ship under these agreements.

In addition, life-saving equipment accepted under the reciprocal acceptance agreement with Norway may also be used on U.S. flag vessel.

The following approval series indicate approval to the SOLAS requirements:

160.017 Embarkation-Debarkation Ladders (only if marked “SOLAS 74/83”)*
160.040 Line-throwing appliances
160.115 Winches (if winches for rescue boat)**
160.117 Embarkation-Debarkation Ladders*
160.118 Rigid liferafts***
160.121 Hand red flares
160.122 Floating orange smoke signals
160.132 Davits (if davits for rescue boat)**
160.135 Lifeboats**
160.136 Rocket parachute flares
160.150 Ring life buoys*
160.151 Inflatable liferafts***
160.155 Lifejackets
160.156 Rescue boats***
160.157 Self-activating smoke signals
160.162 Hydrostatic release units*
160.163 Liferaft launching appliance
160.170 Liferaft automatic disengaging apparatus
160.171 Immersion suits
160.174 Thermal protective aids
160.175 Marine Evaluation Systems ***
160.176 Inflatable Lifejackets (SOLAS)
161.110 Floating electric water lights
161.112 Lifejacket lights
163.003 Pilot Ladders to comply with SOLAS V/17, IMO Res. A.889(21
Accommodation ladders which are used in conjunction with a pilot ladder for
pilot transfer need not be approved under USCG approval series 163.003.
Such accommodation ladders may be approved by ABS under the Alternate
Compliance Program to the requirements of SOLAS Ch.II-2/Reg. 3-9.

Those items without an asterisk (*) are to be forwarded directly to the USCG for their
approval.
* indicates those items for which ABS possesses USCG acceptance to conduct approval
(design review and testing) work on behalf of the USCG.
** indicates items which come under the U.S. District Court Order of 31 May 1983, which
declares invalid any inspection or test not conducted by or in the presence of a USCG
Marine Inspector. The Order does not address pre-approved reviews. This Order remains
in effect until such time as the USCG publishes a final regulation in the Federal Register
removing the requirement for a USCG Marine Inspector to witness the inspections or test.
*** indicates that the USCG reserves the right to attend prototype testing of this equipment as
a condition of approval. This option will normally be exercised in the case of a
manufacturer seeking approval of this equipment for the first time, or for a substantially
new or innovative design.

Where a particular life-saving appliance or arrangement is required, the Commandant, USCG,
may accept any other appliance or arrangement that is at least as effective as that specified. If
necessary, the Commandant, USCG, may require engineering evaluations and tests to
demonstrate the equivalence of the substitute appliance or arrangement.
Life-saving appliances carried on board the ship in addition to equipment of the type required under this part must be approved equipment or be acceptable to the cognizant USCG Officer in Charge of Marine Inspection (OCMI) for use on the ship.

Cite: III/6 Communications

Each item of radio communications equipment must be type accepted by the Federal Communications Commission.

Cite: III/7 Personal Life-Saving Appliances

Each child-size lifejacket and immersion suit must be appropriately marked and stowed separately from adult or extended-size devices.

Each lifejacket and immersion suit must be marked with the vessel’s name.

Inflatable lifejackets, if carried, must all be of the same or similar design.

Each lifejacket, immersion suit, and anti-exposure suit container must be marked in block capital letters and numbers with the quantity, identity, and size of the equipment stowed inside the container. The equipment may be identified in words or with the appropriate symbol from IMO Resolution A.760(18).

Cite: III/8 Muster List and Emergency Instructions

Instructions for passengers must include illustrated instructions on the method of donning lifejackets.

Cite: III/11 Survival Craft Muster and Embarkation Arrangements

If a davit-launched survival craft is not intended to be moved to the stowed position with persons on board, the craft must be provided with a means for bringing it against the side of the vessel and holding it alongside the vessel to allow persons to safely disembark after a drill.

Cite: III/13 Stowage of Survival Craft

Each life-raft must be arranged to permit it to drop into the water from the deck on which it is stowed. The liferaft stowage arrangement meets this requirement if it

(i) is outboard of the rail or bulwark,
(ii) is on stanchions or on a platform adjacent to the rail or bulwark, or
(iii) has a gate or other suitable opening large enough to allow the liferaft to be pushed directly overboard and, if the liferaft is intended to be available for use on either side of the vessel, such gate or opening is provided on each side of the vessel.
In addition to the equipment approved and carried as part of the appliance, each line throwing appliance must also have an auxiliary line that:

1. if other than manila, has a breaking strength of at least 40 kN (9,000 lb);
2. if other than manila, is of a dark color or of a type certified to be resistant to deterioration from ultraviolet light; and
3. is at least 450 m (1,500 ft) long.

The line throwing appliance and its equipment must be readily accessible for use, stowed in its container carried within the pilothouse or on the navigating bridge or stowed in a portable magazine chest.

On a tank vessel certificated to carry cargoes that have a flashpoint less than 60°C (140°F) as determined under ASTM D93-94, each lifeboat or launching appliance of aluminum construction must be protected by a water spray system.

Each unguarded fall must not pass near any operating position of the winch, such as hand cranks, pay out wheels, and brake levers.

The lowering speed for a fully loaded survival craft must be not more than 1.3 m per second (256 ft per minute).

Each fall, where exposed to damage or fouling, must have guards or equivalent protection. Each fall that leads along a deck must be covered with a guard which is not more than 300 mm (12 inches) above the deck.

Each winch drum must be arranged so the fall wire winds onto the drum in a level wrap.

**D. Radiocommunications**

The required EPIRB must be marked with the vessel’s name.
E. Safety of Navigation

Cite: V/22 Navigation Bridge Visibility

In addition to the SOLAS implementation schedule, this regulation applies to all cargo and passenger vessels of 100 m (328 ft) or more in length and contracted for on or after September 7, 1990.

III. ADDITIONAL REQUIREMENTS NOT CONTAINED IN ABS RULES, MARPOL OR SOLAS

A. Diving Support Systems

Diving support systems must meet the following requirements:

(a) Piping for diving installations which is permanently installed on the vessel must meet the requirements of subpart B (Commercial Diving Operations) of 46 CFR part 197.

(b) Piping internal to a pressure vessel for human occupancy (PVHO) must meet the requirements of subpart B of 46 CFR part 197.

B. Accommodations for Officers and Crew

1. Application

(a) The provisions of this section, with the exception of paragraph 13, shall apply to all vessels other than tankships of 100 gross tons and over contracted for on or after November 19, 1952. Vessels other than tankships of 100 gross tons and over contracted for prior to November 19, 1952, shall meet the requirements of paragraph 13.

(b) Vessels other than tankships of less than 100 gross tons shall meet the applicable requirements of this section insofar as is reasonable and practicable.

(c) The provisions of this section, with the exception of paragraphs 14 and 15, apply to all tankships of 100 gross tons and over constructed on or after June 15, 1987.

(d) Tankships of less than 100 gross tons and manned tank barges must meet the requirements of paragraph 14.

(e) Tankships of 100 gross tons and over constructed prior to June 15, 1987, must meet the requirements of paragraph 15.

2. Intent

(a) It is the intent of this section that the accommodations provided for officers and crew on all vessels shall be securely constructed, properly lighted, heated, drained, ventilated, equipped, located, arranged, and, where practicable, shall be insulated from undue noise and effluvia.

(b) The crew referred to herein includes all persons, except the licensed officers, regularly employed on board any vessel. Where the requirements for the accommodation of licensed officers are not otherwise specified, they shall be of at least equivalent to that indicated herein for the crew.
(c) For the purpose of this subpart, the term “crew spaces” shall include sleeping rooms, messrooms, recreational rooms, toilet and shower spaces, etc., which are intended for the exclusive use of the crew.

3. Location of Crew Spaces

(a) Crew spaces shall be located, where practicable, so that the maximum amount of fresh air and light are obtainable, having due regard to the service of the vessel and the requirements of other space users.

(b) Crew quarters shall not be located farther forward in a vessel than a vertical plane located at 5% of the vessel’s length abaft the forward side of the stem at the designed summer load waterline. However, for vessels in other than ocean or coastwise service, this distance need not exceed 28 ft (8.5m). For the purpose of this paragraph, the length shall be as defined in CFR 42.13-15 of subchapter E (Load Lines). No section of the deck of the crew spaces shall be below the deepest load line, except that in special cases, on vessels other than tankships, such an arrangement may be approved provided that in no case shall the deck head of the crew space be below the deepest load line.

(c) Hawse pipes or chain pipes shall not pass through crew spaces.

(d) There shall be no direct communication, except through solid, close fitted doors or hatches between crew spaces and chain lockers, cargo, stowage or machinery spaces.

(e) There shall be no access, vents, or sounding tubes from fuel or cargo oil tanks opening into crew spaces, except that sounding tubes and access openings may be located in corridors.

(f) Where practicable, crew spaces shall be located entirely separate and independent of spaces allotted to passengers or licensed officers.

4. Construction

(a) All crew spaces are to be constructed in a manner suitable to the purpose for which they are intended. The bulkheads separating the crew space from cargo and machinery spaces, lamp and paint rooms, storerooms, drying rooms, washrooms, and toilet spaces shall be made odorproof.

(b) Toilet spaces, except when provided as private or semiprivate facilities, shall be so built, fitted, and situated, that no odor from them will readily enter other crew spaces.

(c) Where the shell or unsheathed weather decks form boundaries of crew spaces, suitable protective coverings shall be applied to prevent formation or accumulation of moisture.
(d) Where crew spaces adjoin or are immediately above spaces such as galleys machinery spaces or casings, donkey boilerrooms, etc., they shall be suitably protected from the heat and noise.

(e) The interior sides and deckheads of crew spaces shall be covered with enamel, paint, or other material light in color.

(f) Crew spaces shall be properly drained where considered necessary.

(g) All washrooms and toilet rooms shall be properly drained and so constructed and arranged that they can be kept in a clean, workable, and sanitary condition. The scuppers shall be located in the lowest part of the space, due consideration being given to the average trim of the vessel.

5. Sleeping Accommodations

(a) Arrangements

(1) Separate sleeping accommodations are to be provided for the deck, engine, and steward groups of the crew.

(2) Each watch of seamen, firemen or similar ratings on duty in watches is to be provided with separate sleeping room or rooms, unless the total space for accommodations makes this impracticable.

(3) Where practicable, each licensed officer shall be provided with a separate stateroom.

(b) Size

(1) Sleeping accommodations for the crew shall be divided into rooms, no one of which shall berth more than four persons. Except on passenger ships requiring a large number of personnel in the steward’s department, rooms may be arranged to accommodate not more than 10 such persons.

(2) Each room shall be of such size that there are at least (2.79 m³) 30 ft² of deck area and a volume of at least (6 m³) 210 ft³ for each person accommodated. The clear headroom shall be not less than (1.9 m) 6 ft 3 in. In measuring sleeping quarters allocated to crews of vessels, any equipment contained therein for the use of the occupants is not to be deducted from the total volume or from the deck area.

(c) Equipment

(1) Each person shall have a separate berth and not more than one berth shall be placed above another. The berths shall have a framework of metal or other hard, smooth material not likely to corrode or harbor vermin, and shall be so arranged that they provide ample room for easy occupancy. The overall size of a berth
shall not be less than (762 mm) 30 in wide by (1930 mm) 76 in long, except by special permission of the Commandant, USCG. Where berths adjoin, they shall be divided by a partition not less than 457 mm (18 in) in height. Where two tiers of berths are fitted, the bottom of the lower must not be less than 305 mm (12 in) above the deck, and the bottom of the upper must not be less than 0.76 m (2 ft 6 in) both from the bottom of the lower and from the deck overhead. The berths shall not be obstructed by pipes, ventilating ducts, or other installations.

(2) A locker of metal or other hard, smooth material shall be provided for each person accommodated in a room. Each locker shall be not less than 1935 cm² (300 in²) in cross section area and 1524 mm (60 in) high. It shall be so placed as to be readily accessible. The interior of the locker shall be so arranged as to facilitate the proper stowage of clothes.

6. Wash Spaces; Toilet Spaces; and Shower Spaces

(a) For the purposes of this section

(1) Private facility means a toilet, washing, or shower space that is accessible only from one single or double occupancy sleeping space;

(2) Semiprivate facility means a toilet, washing, or shower space that is accessible from one or two one-to-four person occupancy sleeping spaces; and

(3) Public facility means a toilet, washing, or shower space that is not private or semiprivate.

(b) Each private facility must have one toilet, one shower, and one washbasin, all of which may be in a single space.

(c) Each semiprivate facility must have at least one toilet and one shower, which may be in a single space.

(d) Each room adjoining a semiprivate facility must have a washbasin if a washbasin is not installed in the semiprivate facility.

(e) Each tankship must have enough public facilities to provide at least one toilet, one shower, and one washbasin for each eight persons without private facilities.

(f) Urinals may be installed in toilet rooms, but no toilet required in this section may be replaced by a urinal.

(g) Each public toilet space and washing space must be convenient to the sleeping space that it serves.

(h) No public facility may open into any sleeping space.
(i) Each washbasin, shower, and bathtub must have hot and cold running water.

(j) Adjacent toilets must be separated by a partition that is open at the top and bottom for ventilation and cleaning.

(k) Public toilet facilities and shower facilities must be separated.

(l) Each public facility that is a toilet space must have at least one washbasin unless the only access to the toilet space is through a washing space.

(m) Each washing space and toilet space must be so constructed and arranged that it can be kept in a clean and sanitary condition and the plumbing and mechanical appliances kept in good working order.

(n) Washbasins may be located in sleeping spaces.

7. Messrooms

(a) Messrooms shall be located as near to the galley or suitably equipped serving pantry as is practicable, except where messroom is equipped with a steam table. The messrooms shall be of such size as to seat the number of persons normally scheduled to be eating at one time.

(b) Messrooms shall be properly equipped with tables, seats, and other necessary equipment and shall be so arranged as to permit access to each seat.

8. Hospital Space

(a) Except as specifically modified by paragraph (f) of this section, each vessel, which in the ordinary course of its trade makes voyages of more than 3 days duration between ports and which carries a crew of 12 or more, shall be provided with a hospital space. This space shall be situated with due regard to the comfort of the sick so that they may receive proper attention in all weathers.

(b) The hospital shall be suitably separated from other spaces and shall be used for the care of the sick and for no other purpose.

(c) The entrance shall be of such width and in such a position as to admit a stretcher case readily. Berths shall be of metal and may be in double tier, provided the upper berth is hinged and arranged to be secured clear of the lower berth when not in use. At least one berth shall be so arranged that it can be made accessible from both sides when necessary.

(d) The hospital shall be fitted with berths in the ratio of one berth to every twelve members of the crew or portion thereof who are not berthed in single occupancy rooms, but the number of berths need not exceed six.
(e) The hospital shall have a toilet, washbasin, and bath tub or shower conveniently situated. Other necessary suitable equipment of such character as clothes locker, table, seat, etc., shall be provided.

(f) On vessels in which the crew is berthed in single occupancy rooms a hospital space will not be required: provided that one room shall be designated and fitted for use as a treatment and/or isolation room. Such room shall meet the following standards:

1. The room must be available for immediate medical use.
2. The room must be accessible to stretcher cases.
3. The room must have a single berth or examination table so arranged that it can be made accessible from both sides when necessary.
4. A washbasin with hot and cold running water must be installed either in or immediately adjacent to the space and other required sanitary facilities must be conveniently located.

9. Other Spaces

(a) Sufficient facilities, depending upon the number of the crew, shall be provided where the crew may wash their own clothes. There shall be at least one tub or sink fitted with the necessary plumbing, including hot and cold running water.

(b) Clothes drying facilities or space shall be provided for the needs of the crew.

(c) Recreation accommodations shall be provided. Where messrooms are used for this purpose, they shall be suitably planned.

(d) A space or spaces of adequate size shall be available on an open deck to which the crew has access when off duty.

10. Lighting

(a) All crew spaces shall be adequately lighted.

(b) Berth lights shall be provided for each member of the crew.

11. Heating

(a) All crew spaces shall be adequately heated in a manner suitable to the purpose of the space.

(b) The heating system will be considered satisfactory if it is capable of maintaining a minimum temperature of 70°F (21°C) under normal operating conditions without undue curtailment of the ventilation.
(c) Radiators and other heating apparatus shall be so placed, and where necessary shielded, as to avoid risk of fire, danger or discomfort to the occupants. Pipes leading to radiators or heating apparatus shall be insulated where those pipes create a hazard to persons occupying the space.

12. Insect Screens

(a) Except in such areas as are considered to be insect free, provisions shall be made to protect the crew quarters against the admission of insects. This may be accomplished by the fitting of suitable screens to ventilating skylights, air ports, ventilators, and doors to unscreened spaces and the open deck or by other methods. Insect screens are not required in air conditioned crew quarters for windows, air ports, and doors that are normally kept closed.

13. For all vessels other than tankships contracted for prior to November 19, 1952.

(a) Vessels of less than 100 gross tons, contracted for prior to November 19, 1952, shall meet the general intent of paragraph and in addition shall meet the following requirements:

(1) Existing structure, arrangements, materials, and facilities, previously accepted or approved will be considered satisfactory so long as they are maintained in a suitable condition to the satisfaction of the Surveyor. Minor repairs and alterations may be made to the same standard as the original construction.

(b) Vessels of 100 gross tons and over, contracted for prior to March 4, 1915, shall meet the requirements of this paragraph.

(1) Existing structure, arrangements, materials, and facilities, previously approved will be considered satisfactory so long as they are maintained in good condition to the satisfaction of the Surveyor. Minor repairs and alterations may be made to the same standard as the original construction: Provided, that in no case will a greater departure from the standards of paragraphs 2 through 12 be permitted than presently exists.

(c) Vessels of 100 gross tons and over, contracted for on or after March 4, 1915, but prior to January 1, 1941, shall meet the requirements of this paragraph.

(1) Existing structure, arrangements, materials, and facilities, previously approved will be considered satisfactory so long as they are maintained in a suitable condition to the satisfaction of the Surveyor. Minor repairs and alterations may be made to the same standard as the original construction.

(2) Where reasonable and practicable, a minimum of one toilet, shower, and washbasin shall be provided for each 10 members of the crew or fraction thereof.
(3) Crew spaces shall have a volume of at least 3.4 m³ (120 ft)³ and a deck area of at least 1.1 m³ (16 ft)³ for each person accommodated.

(4) Each crewmember shall have a separate berth, and berths may not be placed more than two high.

(5) Each vessel, which in the ordinary course of its trade makes a voyage of more than three days’ duration between ports and which carries a crew of 12 or more persons, shall be provided with a suitable hospital space for the exclusive use of the sick or injured. Berths shall be provided in the ratio of one berth for each twelve members of the crew or fraction thereof, but the number of berths need not exceed six.

(6) The crew spaces shall be securely constructed, properly lighted, heated, drained, ventilated, equipped, located, and arranged, and where practicable, shall be insulated from undue noise and effluvia.

(d) Vessels of 100 gross tons and over, contracted for on or after January 1, 1941, but prior to November 19, 1952, shall meet the requirements of this paragraph.

(1) Existing structure, arrangements, materials, and facilities, previously approved will be considered satisfactory so long as they are maintained in a suitable condition to the satisfaction of the Surveyor. Minor repairs and alterations may be made to the same standard as the original construction.

(2) Washrooms and Toilet Rooms:

(i) There shall be a minimum of one toilet, shower, and washbasin for each 8 members of the crew or fraction thereof who are not accommodated in rooms having attached private or semiprivate facilities.

(ii) Separate facilities shall be provided for the engine room, deck, or stewards department when the number of crew in that department, exclusive of officers, exceeds 8.

(iii) Toilet rooms shall be separate from the wash rooms. At least one washbasin shall be installed in each toilet room.

(iv) Toilets shall be provided with seats of the open front type. Urinals may be fitted in toilet rooms, if desired, but no reduction will be made in the required number of toilets.

(v) Washbasins, showers, and bath tubs if substituted for showers, shall be equipped with proper plumbing including hot and cold running water.

(3) Crew spaces shall have a volume of at least 3.4 m³ (120 ft)³ and a deck area of at least 1.1 m³ (16 ft)³ for each person accommodated.
(4) Each crewmember shall have a separate berth, and berths may not be placed more than two high.

(5) Each vessel, which in the ordinary course of its trade makes a voyage of more than three days duration between ports and which carries a crew of 12 or more persons, shall be provided with a suitable hospital space for the exclusive use of the sick or injured. Berths shall be provided in the ratio of one berth for each 12 members of the crew or fraction thereof, but the number of berths need not exceed six.

(6) The crew spaces shall be securely constructed, properly lighted, heated, drained, ventilated, equipped, located, and arranged, and where practicable, shall be insulated from undue noise and effluvia.

14. Crew accommodations on tankships of less than 100 gross tons and manned tank barges

(a) The crew accommodations on all tankships of less than 100 gross tons and all manned tank barges must have sufficient size and equipment, and be adequately constructed to provide for the protection of the crew in a manner practicable for the size, facilities, and service of the tank vessel.

(b) The crew accommodations must be consistent with the principles underlying the requirements for crew accommodations on tankships of 100 gross tons or more.

15. Crew accommodations on tankships constructed before June 15, 1987

All tankships of 100 gross tons and over constructed before June 15, 1987 may retain previously accepted or approved installations and arrangements so long as they are maintained in good condition to the satisfaction of the Surveyor.

C. Passenger Spaces

1. Ventilation

Passenger spaces are to be provided with adequate ventilation.

D. Navigation Safety Requirements that Apply to All Vessels

This section applies to all self propelled vessels over 1600 gross tons when operating in the navigable waters of the United States, except the St. Lawrence Seaway.

Cite: 33 CFR 164.35(g) Navigational Equipment

1. Application

(a) The provisions of this section apply to all self propelled vessels over 1600 gross tons when operating in the navigable waters of the United States, except the St. Lawrence Seaway.
2. Maneuvering Information

(a) Maneuvering characteristics must be posted prominently on a fact sheet in the wheelhouse. The requirements for posting maneuvering information are found in 33 CFR 164.35. The maneuvering characteristics are to be representative of both normal load, normal ballast conditions, calm weather (wind 10 knots or less), no current, deep water (at least twice the vessel’s draft), and clean hull. At the bottom of the fact sheet the following statement shall be provided:

“WARNING”
The response of the (name of vessel) may be different from that listed above if any of the following conditions, upon which the maneuvering information is based, are varied:

(1) Calm weather – wind 10 knots or less, calm sea;
(2) No current;
(3) Water depth twice the vessel’s draft or greater;
(4) Clean hull; and
(5) Intermediate drafts or unusual trim.

(b) The posted characteristics shall consist of the following maneuvers:

(1) Turning Circle Diagram to both port and starboard.
   - Time, distance, advance, transfer to alter course 90° with maximum power settings for either full or half speeds, or full and slow speeds.
   - Vessels which have essentially the same turning characteristics to both port, and starboard may substitute a turning circle in one direction only, with a note stating the other direction to be essentially the same.
   - Time and Distance to Stop the vessel from either full and half speeds while maintaining initial heading, and minimum rudder application.
   - Table of Shaft RPM for a representative range of speeds should be provided for a vessel with a fixed pitch propeller.
   - Table of Control Settings for a representative range of speeds for a vessel with a controllable pitch propeller.
   - Table of Effective Speeds for auxiliary maneuvering devices such as bow thrusters. This table should show the range of speeds for which the unit can be used effectively.

These provide guidance to the owner and operator concerning maneuvering performance estimation and a standardized format for presentation of ship maneuvering information to operating personnel, including pilots.

33 CFR 164.33(3)(ii)

1. Application

(a) The provisions of this section apply to all self propelled vessels over 1600 gross tons when operating in the navigable waters of the United States, except the St. Lawrence Seaway.

2. Requirements

(a) In addition to the requirements of SOLAS, a vessel must have a current copy of the “U.S. Coast Pilot”, and “Tidal Current Tables”, published by the National Oceanographic Service. Further detail is provided in 33 CFR 164.33.

Cite: 33 CFR 164.41 Electronic Position Fixing Devices

1. Application

(a) The provisions of this section apply to all self propelled vessels over 1600 gross tons and calling at a port in the United States, including Alaska south of Cape Prince of Wales. Each vessel operated, owned, or bareboat chartered by the United States, State, or Political Subdivision, by a foreign nation, and not engaged in commerce is exempt from this requirement. Requirements for electronic position fixing devices are found in 33 CFR 164.41.

2. Devices

(a) A Type I or Type II Loran C Receiver meeting Part 2 (Minimum Performance Standards of the Radio Technical Commission for Marine Services (RTCM) Paper 12-78/DOD100. Each receiver installed on or after June 1, 1982 must have a label showing the name and address of the manufacturer, including the following statement: “This receiver was designed and manufactured to meet Part 2 (Minimum Performance Standards) of the RTCM MPS for Loran-C Receiving Equipment.”

(b) A Satellite Navigation Receiver with automatic acquisition of satellite signals, and position updates derived from satellite information.

(c) A system considered to meet the intent for availability, accuracy, and coverage for the U.S. Confluence Zone (CCZ) contained in U.S. “Federal Radio Navigation Plan” (Report No. DOD-No 4650.4-D or No. DOT-TSC-RSPA-80-161).
E. Requirements in Addition to MARPOL Annexes

Under fill connections and vents there must be a fixed container or enclosed deck area with a mechanical means of closing the drain for that containment which has a capacity:

- 1/2 bbl for vessels 300 gross ton or more but less than 1600 gross tons.
- 1 bbl for vessels 1600 gross ton or more

Cite: 33 CFR 155.380 Oily-water Separating Equipment, Bilge Alarm and Bilge Monitor Approval Standards

Oily-water separating equipment and oil content meters for bilge alarms are to be USCG approved equipment.

Cite: 33 CFR 155.450 Placard

Each machinery space must have a sign indicating that the discharge of oil is prohibited.

Cite: 33 CFR 155.780 Emergency Shutdown

Tank vessel must have an emergency means of stopping transfers within a vessel.

Cite: 33 CFR 155.790 Deck Lighting

Tank vessels must have a means of illuminating the deck in transfer operation work areas – 1.0 foot candle measured 0.91 m (3ft) above the deck – and at transfer connections – 5.0 foot candle measured 0.91 m (3ft) above the deck.

Cite: 33 CFR 155.800 Transfer Hoses

Transfer hoses must have burst pressure of at least 600 psi and four times the MAWP, which must be at least 10.3 bar (150 psi). Hose flanges must meet ANSI B16.5 or B16.24. The hoses must be marked with the MAWP, type of service, date of manufacture and the date of the last pressure test. The date of manufacture and the date of the last pressure test may be recorded in lieu of being marked on the hoses.

Cite: 33 CFR 155.1010 Response Plans – Purposes

Applies to tank vessels without regard to size. (Reg. 37 applies to tank vessels greater than 150 gross ton and all vessels greater than 400 gross ton applies to discharges of oil. (Reg. 37 applies to all discharges of oil.) Requires formal agreements for spill notification and cleanup. (Reg.37 requires only shipboard procedures and a shoreside contact.) Requires a geographic specific appendix for U.S. ports. (Reg. 37 requires a worldwide list.)
Cite: 33 CFR 157.03(n) Definition – Oil

Oil is not limited to petroleum and includes animal fats and other “oils.” (MARPOL regulates animal fats and vegetable oils under Annex II.)

Cite: 33 CFR 157.10b Segregated Ballast Tanks, Dedicated Clean Ballast Tanks, and Special Ballast Arrangements for Tank Vessels Transporting Outer Continental Shelf Oil

Tank vessels servicing the OCS are permitted to carry ballast water in cargo tanks. (MARPOL makes no special allowances for these sorts of vessels.)

Cite: 33 CFR 157.10d Double Hulls on Tank Vessels

U.S. dates for required double hull construction are three (3) years earlier than Reg. 19.

There is no minimum tonnage limit for applicability to vessels. (Reg. 19 applies for vessels greater than 5000 dwt.)

Cite: 33 CFR 157.12 Cargo Monitor and Control System

The oil discharge monitoring and control system is to be USCG approved equipment. The ODMC system manual is also required to be approved.

Cite: 33 CFR 157.15 Slop Tanks in Tank Vessels

The oily/water detectors installed on slop tanks are to be USCG approved equipment.

Cite: 33 CFR 157.21 Subdivision and Stability

For US Flag vessels, MARPOL damage stability requirements are applicable to the following vessels:

(a) New vessels delivered after 31 December 1977
(b) New vessels contracted after 31 December 1974, and
(c) New vessels whose keels were laid (or similar stage of construction) after 30 June 1975

“New vessel” (defined in 157.03) applies to vessels as under contract, constructed, or completed between 1975/1976/1979. (Reg. 1.28.4) defines “new” as four (4) years later.)

Interpretation: MARPOL Reg. 18.5
Segregated ballast tanks, dedicated clean ballast tanks and crude oil washing. Vessels less than 150 m in (412 ft) length: The U.S. has not adopted the requirements in Appendix 1 to Annex I which addresses segregated ballast for vessels less than 150 m (412 ft) in length. Determination under this regulation must be made by the Commandant, USCG.
Interpretation: MARPOL Reg. 19.4
Prevention of oil pollution in the event of collision or stranding. Mid-deck tankers: The U.S. has not ratified that the mid-deck design is equivalent to a double hull.

Interpretation: MARPOL Reg. 20
Prevention of oil pollution in the event of collision or stranding. Determinations by the Administration: The Commandant, USCG, makes determinations on behalf of the U.S.

Interpretation: MARPOL Reg. 28.1.3
Subdivision and Stability. Stability for vessels under 100 m (328 ft): The Commandant, USCG, makes determinations concerning the relaxation requirements for vessels less than 100 m if the standards for a vessel 150 m (412 ft) or longer would impair the operational qualities of the ship.

ANNEX II

Navigation and Vessel Inspection Circular No. 03-06 provides “Guidance on implementation of revisions to MARPOL Annex II and the IBC Code,” which is considered to be U.S. Coast Guard policy.

“Each incinerator installed on or after March 26, 1998 must meet the requirements of IMO Resolution MEPC.76(40). A Coast Guard Certificate of Approval is required for each incinerator. Incinerators in compliance with the following are considered to meet IMO Resolution MEPC.76(40):

- ISO 13617; or
- Both ASTM F 1323 and Annexes A1-A3 of IMO Resolution MEPC.76(40)

CHECKLIST ON ACP CLASSIFICATION SURVEYS SLC IV-1
CHECKLIST ON ACP STATUTORY SURVEYS SLE IV-2
CHECKLIST ON ACP ENVIRONMENTAL SURVEYS AND MARPOL V IV-4
CHECKLIST ON ACP CLASSIFICATION SURVEYS
ALTERNATE COMPLIANCE AND THE US SUPPLEMENT TO ABS RULES
TO BE DONE IN CONJUNCTION WITH INITIAL, MAS, AND RENEWAL SLC SURVEYS

1. On vessels not classed ACC, automation systems for propulsion and auxiliary boilers were tested with USCG-approved procedures and found satisfactory.

2. The vessel’s Chief Engineer certified that all aspects of the vessel’s automated equipment has been routinely and recently tested using the USCG-approved Periodic Automation Test Safety Procedure (or approved by ABS on behalf of the USCG) and found satisfactory.

3. Was the ABS Class Annual Automation Survey (AAS) satisfactorily carried out, utilizing the USCG or ABS approved Periodic Automation Test Safety Procedure?

4. It was confirmed that vessels with unattended Machinery Spaces had a planned maintenance program, including maintenance and repair manuals and routine maintenance and checksheets?

5. The remote controls of valves in hull penetrations were randomly tested. Proper operation of reach rods, control actuators and function indicators were randomly verified and found satisfactory.
   a. At the SLC renewal, a more detailed examination, to the satisfaction of the Surveyor, was conducted.

6. Throttle control apparatus was demonstrated in manual and power modes at all stations and related alarms and trips were verified operational.

7. A general examination was conducted of ladders, handrails, ramps, catwalks, accommodation ladders, and protective guards on machinery to ensure these items were in good general repair and suitable to protect personnel.

8. Draft marks, vessel name and hailing port were accurately affixed and displayed.

9. Machinery space tank tops and bilges were examined for accumulation of oil or other substances that could pose a fire hazard.
   a. Unsafe conditions were corrected.

10. Power operated trucks were marked with testing laboratory mark designation as specified in 46 CFR 35.70-74 and 46 CFR 78.80 or 46 CFR 97.70-7 as applicable and suitable for the hazard classification in the space employed.

11. An operational test was conducted of the main and emergency bilge pump suctions.

12. The main and auxiliary piping systems were examined externally and found free of apparent leakage.
   a. The flexible non-metallic expansion pieces in the circulating system were identifiable by manufacturer and verified by the Chief Engineer to have less than 10 years of service.

13. The vessel’s Master and Chief Engineer confirmed that the vessel had no 835s or other conditions that needed to be brought to my attention.

14. The crew did not report, nor did I see any unsafe or unsanitary conditions of a concern.

15. If any of the above questions is answered “No,” the local OCMI must be informed before the vessel sails. The source of the information is to be kept confidential.
CHECKLIST ON ACP STATUTORY SURVEYS
ALTERNATE COMPLIANCE AND THE US SUPPLEMENT TO ABS RULES
TO BE DONE IN CONJUNCTION WITH INITIAL, MAS, AND RENEWAL SLE SURVEYS

I. Fire Hose Testing

1. All fire hoses were hydrostatically tested to the maximum fire pump pressure to which they may be exposed but not less than a minimum pressure of 6.9 bar (100 psi). Note: The Safety Equipment Certificate may not be issued or endorsed if this is not done.

II. Liferaft Servicing

Note: Lack of certification is a No Sail item and the local OCMI must be contacted.

1. Note: New Regulations have been published regarding the servicing of liferafts. USCG field offices perform initial service facility approval and periodic spot checks, but third parties may be substituted. A new sticker system on the liferaft itself should be used in conjunction with the certificate to determine proper servicing.

2. Liferaft certificates indicate current servicing by a USCG approved facility. Note: The information must contain the port of servicing and the date of servicing.

III. Lifeboat Operational Tests

1. Proper operation of the propelling gear and/or motors was demonstrated. (IMO allows this testing to be carried out while the boat is secured in the falls.)
   a. The CG inspectors will have a crew proficiency test to conduct during their boarding. At that time, the crew must operate each boat in the water, and the following tests will be carried out:
   b. The USCG will accept load tests done by ABS.

2. Each motor lifeboat and hand-propelled boat was operated at full speed both ahead and astern.

3. Each installed system, such as any powered bilge pump or water spray system, was successfully operated.

4. Compass readings were compared with several known bearings.

5. Each air tank buoyancy unit was visually inspected and appears fit for service. Note: In case of doubt, air tanks may be tested for air-tightness per Marine Safety Manual, Chapter 6, Section R.

6. Water tanks were inspected and confirmed watertight. Note: This should be demonstrated by either an airtight test or filling with water and watching for leaks. Refer to Marine Safety Manual, Chapter 6, Section R.

7. Batteries for engine starting and searchlights have a means for recharging, which are in satisfactory condition.

8. The condition and quantity of survival equipment was checked as per the standard ABS checklists.

IV. Advice for Lifeboat Weight Tests

1. The USCG has requirements in addition to SOLAS. The USCG requires weight testing of the lifeboats during each inspection for certification and whenever the falls are turned end-for-end or renewed.
2. The primary references for USCG lifeboat testing and inspection are:
   a. Title 46, Code of Federal Regulations Part 199.45 and

3. The CFR contains the performance standard required, while the process used to verify compliance with the standard is found in the Marine Safety Manual (MSM). A brief summary of the lifeboat test and inspection requirements and the verification process follows. If difficulties are encountered, please ask for advice from the local OCMI.

V. Tests and Inspections Required

1. At each Safety Equipment Inspection that will be used by the United States Coast Guard for their renewal or mid-period Certification, a demonstration showing the proper condition and operation of lifeboats and their launching appliances at loads ranging from light load to full load is required. A demonstration of the proper condition and operation of launching appliances at loads ranging from light load to 10% overload is required whenever the falls are turned end-for-end or renewed. During an inspection for initial or renewal of SLE, any portion of the load test conducted in connection with replacement or end-for-ending a fall since the vessel’s previous inspection for initial or renewal of SLE need not be repeated.

2. Light Load Test The boat should be lowered into the water and released. Operating the launching system at light load demonstrates that the mass of the boat is sufficient to overcome the frictional resistance of the winch, falls, sheaves, blocks and associated gear. This test is specially important on older installations to test the condition of rollers, bushings, bearings, and other rolling and sliding parts.

3. Full Load Test The boat is lowered to the embarkation position. Tricing pendants are disconnected. Weight is added to bring the lifeboat to full load condition. During loading, the boat should be held alongside the ship by means of the installed frapping and/or bowing gear. The fully loaded boat should be lowered using the normal lowering procedure and using the on-deck winch control position. During lowering, alternatively release and apply the brake so that the boat stops at approximately 2 m intervals. Complete at least three start-stop cycles. Stop lowering just as the boat reaches the water. The keel should be at or in the water but there should still be tension on the falls. Release the boat using the on-load release mechanism control. Release mechanisms with a hydrostatic lock will require use of the emergency override device to permit on-load release. The release mechanism must open all hooks simultaneously and release the boat into the water. Unload the boat, recover it with the winch, and return it to its stowed position. Observe operation of the limit switches as the davit approaches the stowed position. Anyone on board the boat should disembark at the deck level.

5. During the test, there should be no deformation of, or damage to the launching appliance or its connection to the vessel. The brake must be a “DEADMAN” type. When the operator releases the brake handle, the davit must apply the brake, stopping the boat, without any additional force.

TO BE DONE IN CONJUNCTION WITH INITIAL, MAS, AND RENEWAL MARPOL
ANNEX I SURVEYS

1. Marine Portable Tanks (MPTs), were labeled showing compliance with IM 101, IM 102, or
   exemption issued according to 49 CFR 107 (Subpart B) and installed and tested IAW 46 CFR 64.

2. The Vessel's Fuel and Bulk Oil Containment arrangements were examined and found to be in
   compliance with 33 CFR 155.320.

3. The Vessel's Oil Placards indicating that discharge of oil is prohibited were examined and found
   in each machinery space and at control stations for ballast and bilge controls.

4. Cargo Discharge Containment arrangements were examined and found to be in compliance with
   33 CFR 155.310.

5. Emergency Shutdown of cargo transfers within the vessel was examined and found to be in
   compliance with 33 CFR 155.780.

6. On tank vessels, is the illumination of the deck in transfer operation work areas and at transfer
   connections adequate? 33 CFR 155.790(b)

7. Cargo Transfer Hose testing was witnessed or an affidavit sighted from a responsible individual,
   that hoses had been hydrostatically tested and marked according to 33 CFR 155.800.
   a. Pipe and manifold labeling was checked for accuracy and legibility.

8. Tank Vessel's approved OPA Vessel Response Plan complying with 33 CFR 155.1010 was
   verified onboard.

9. Vessel's approved shipboard oil pollution emergency plan (SOPEP) (MARPOL ANNEX 1,
   REGULATION 26), was verified on board.

10. Tank Vessel of length 400 ft or greater was examined and found to have Oil Discharge Removal
    Equipment complying with 33 CFR 155.205 for on-deck spills up to 12 bbl stowed in marked
    location.

11. Tank Vessel of length less than 400 feet was examined and found to have Oil Discharge Removal
    Equipment complying with 33 CFR 155.210 for on-deck spills up to 7 bbl stowed in marked
    location.

12. Vessel was examined and found to have oil discharge removal equipment complying with 33 CFR
    155.220 (Permit issued or NLS Certificate issued) and COI authorized C and D NLS Cargoes.

13. Tank Vessel's Cargo Internal Transfer Equipment was examined and found to be in compliance
    with 33 CFR 155.225.

14. Vapor control systems were examined for compliance with 46 CFR 39, and a representative
    sample of alarms were tested and found to be in proper operation.

15. NOTE: Tank Vessel carrying animal fats and “other oils” are considered as a vessel carrying “oil”
    in accordance with 33 CFR 157.03(n).

ANNEX V (Garbage) SURVEYS

1. The Vessel was verified to be keeping Garbage Disposal Records required by 33 CFR 151.55.

2. The Vessel’s approved Waste Management Plan complying with 33 CFR 151.57 was verified onboard.

3. Placards describing prohibited waste discharges as required by CFR 151.59 were verified as posted.
V. SURVEYS DURING CONSTRUCTION

CHECKLIST ON ACP CLASSIFICATION SURVEYS NCS  V-1
ACP NEW CONSTRUCTION SURVEYS
ALTERNATE COMPLIANCE AND THE US SUPPLEMENT TO ABS RULES –
NEW CONSTRUCTION
TO BE DONE IN CONJUNCTION WITH ISSUANCE OF THE INTERIM
CLASSIFICATION CERTIFICATE

1. The Surveyors involved with the new construction were qualified in the ACP process and the ABS processes for new construction.

2. Are communication cables routed to avoid high risk fire areas and are telephone installations in the weather located in a watertight enclosure with an external audible signaling device?

3. Is the stop control for the emergency generator located only in the room containing the emergency generator?

4. Were the additional requirements for vessels carrying hazardous cargoes complied with and tested as necessary?

5. Were valves verified to meet the requirements of positive shutoff category A or category B in the required piping system?

6. Sounding tubes, where fitted to oil tanks, were verified to not have perforations or openings throughout their length?

7. For vessels with automatic or remote control and monitoring systems, are the following approved manuals found on board:
   a. Qualitative Failure Analysis (propulsion controls, monitoring and alarm systems, automated electric power management system, all other automated systems that may potentially constitute a safety hazard (e.g. stabilization systems, integrated propulsion/steering systems)
   b. Planned Maintenance Program
   c. Design Verification Test Procedures (all automated systems)

8. Was the steering failure alarm tested and found satisfactory?

9. On tank vessels, were the additional requirements for cargo vapor emission control systems verified?

10. Were all required placards, instructions, and identification labels found to be in accordance with the supplement?

VI. PASSENGER VESSELS – SOLAS INTERPRETATIONS
NOT ADDRESSED BY ABS RULES

Cite: II-1/13  Openings in Watertight Bulkheads Below the Bulkhead Deck in Passenger Ships

All watertight doors in subdivision bulkheads shall be numbered conspicuously on both sides on an etched plate or equivalent in not less than 10 mm (3/8 in) letters and figures “W.T.D. 1,” “2,” “3,” etc. If stenciled or similar notice is used, the letters and figures shall be at least 25 mm (1 in) high. If the construction is such that the number cannot be seen with the door in the open position, a similar number shall be placed on the frame or other location immediately adjacent to the door. All watertight door remote control stations shall be marked in the same manner, and in addition, the direction of operation of the lever or wheel to open and close the door shall be conspicuously marked. Doors fitted in accordance with Subdivision and Stability requirements must be additionally marked “RECLOSE AFTER USE.”

Cite: II-1/17  Internal Watertight Integrity of Passenger Ships Above the Bulkhead Deck

Arrangement to ensure the watertight integrity of the structure above the bulkhead deck must adhere to the guidance contained in MSC/Cir.541- Guidance Notes on the integrity of flooding boundaries above the bulkhead deck of passenger ships for proper application of SOLAS Chapter II-1. Coamings of ample height means at least 15.2 cm (5.98 inches.)

Cite: II-1/42  Emergency Source of Electrical Power in Passenger Ships

There must be visible indicators in the machinery space to show when the automatically controlled emergency power source is supplying the emergency loads.

Cite: II-2/13  Means of Escape

Stairways on passenger ships shall comply with the following:

The two means of escape required by Regulation 13, paragraphs 3.2.1 and 3.2.2 shall be as remote as possible to minimize the possibility of one incident blocking both escapes. Vertical ladders and deck scuttles shall not in general be considered as one of the required means of escape. However, where it is demonstrated that the installation of a stairway would be impracticable, a vertical ladder may be used as the second means of escape.

Doors giving access to either of the two required means of escape shall not be lockable, except that crash doors or locking devices, capable of being easily forced in an emergency, may be employed provided that a permanent and conspicuous notice giving instructions on how to open the door or lock is attached to both sides of the door.

Vertical communication shall be provided between weather decks by means of permanent inclined ladders. Where ladders are for the exclusive use of the crew, and do not form part of the escape route, vertical ladders may be employed.
Small rooms or spaces having a secondary means of escape which is not obviously apparent shall have a suitable sign in red letters “EMERGENCY EXIT” directing attention to such escape.

Readily accessible enclosed stairway as referred to in SOLAS II-2/13.3.2.4.1 is defined to mean it must either be in the MVZ or immediately adjacent to the zone such that entrance into the stairway does not require entering into the adjoining zone to gain access to the stairway.

In addition to the requirements of paragraph 3.2.1.2, the requirements of paragraph 7.3.1 apply to corridors which are 6 feet or more in width in all passenger vessels.

Cite: II-2/20.6 Protection of Special Category Spaces

Where a manual sprinkling system is installed for protection of vehicle decks, it shall comply with Regulation II-2/20.6.1.2, IMO Assembly Resolution A.123(V), and the following:

Capacity and Arrangement

The system shall be arranged to effectively distribute water into all spaces to be protected. The application rate shall be at least 3.5 liters/min/m² (0.07gal/min/ft²) for spaces with a deck height not exceeding 2.5 m (8.2 ft) and a capacity of at least 5 liters/min/m² (0.1gal/min/ft²) for spaces with a deck height of 2.5 m (8.2 ft) or more.

Controls

Complete, but simple instructions for the operation of the system shall be located in a conspicuous place at or near the controls.

Piping

All piping, valves, and fittings shall meet Part 4, Chapter 6 of the ABS Steel Vessels Rules for pipe material, pipe design, fabrication and testing, and piping general installation requirements as modified by this supplement

All piping, valves, and fittings of ferrous materials shall be protected inside and outside against corrosion unless specifically approved otherwise.

All piping, valves, and fittings shall be securely supported, and where necessary, protected against injury.

Drains, strainers and dirt traps shall be fitted where necessary to prevent the accumulation of dirt or moisture.

Distribution piping shall be used for no other purpose.

Markings

The control cabinets or spaces containing valves or manifolds shall be distinctly marked in conspicuous red letters at least 50 mm (2 in) high – “MANUAL SPRINKLING SYSTEM”.

VI - 2
Cite: II-2/20.6 & II-2/20.3.1.3

Protection of Special Category Spaces

The alarm required to indicate loss of ventilation in spaces specially suitable for vehicles shall be marked with a conspicuous sign in at least 8 mm (1/4 in) letters “VENTILATION FAILURE IN VEHICULAR SPACE.”

Cite: III/22

Personal Life-Saving Appliances

Immersion suits and thermal protective aids are required to be provided for persons accommodated in totally or partially enclosed lifeboats, unless the vessel operates only on routes between 32 degrees north and 32 degrees south latitude.

Cite: III/22.4.1.2

Personal Life-Saving Appliances – Immersion Suits and Thermal Protective Aids

The warm climate exemption in Regulation 22.4.1.2 applies to ships operating only on routes between 32 degrees north and 32 degrees south latitude.

An immersion suit or anti-exposure suit of suitable size for each person is to be provided for each person assigned to a marine evacuation system crew.
VII. IBC CODE SUPPLEMENTAL REQUIREMENTS

Unless otherwise noted below, ABS is authorized to interpret the expressions “left to the satisfaction of the Administration,” or similar expressions in the IBC Code pertaining to the International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk.

Navigation and Vessel Inspection Circular No. 03-06 provides “Guidance on implementation of revisions to MARPOL Annex II and the IBC Code,” which is considered to be U.S. Coast Guard policy.

Chapter 1 – General

1.1.3 USCG will handle matters relating to carriage conditions of cargoes not listed in the IBC Code.

1.3.16 The approved closed cup flashpoint test uses the Tagliabue apparatus.

1.3.2 Generally, USCG acts as the administration for findings of equivalency.

1.5 Under this section, the Administration means the USCG.

1.5.4.1 The Certificate of Fitness issued by ABS on behalf of the USCG will not include an asterisk against the ship’s type notation

Chapter 2 – Ship Survival Capability and Location of Cargo Tanks

2.2.2 Intact Stability shall also meet the requirements for gas carriers contained in 46 CFR Subchapter S (or equivalent) for gas carriers 46 CFR 172.165, which states:

(a) Design calculations must show that 2 inches (50 mm) of positive metacentric height can be maintained by each tankship when it is being loaded and unloaded.

(b) For the purpose of demonstrating compliance with the requirements of paragraph (a) of this section, the effects of the addition of water ballast may be considered.

2.3.3 The valve shall be to ABS rules.

2.8.2 No dispensations for smaller ships will be allowed.

2.9.2.3 Residual stability should not be less than that allowed in 2.9.3.
Chapter 3 – Ship Arrangements

3.4.4 Smaller dimensions are not permitted unless authorized by the USCG.

3.7.2 Toxic cargoes cannot be unloaded bow or stern unless authorized by the USCG.

3.7.3 USCG must authorize relaxations.

3.7.3.5 Alternative arrangements must be authorized by the USCG.

Chapter 4 – Cargo Containment

4.1.3 ABS rules apply for tank testing.

4.1.4 ASME Code Section VIII, Division 1 or 2, applies for pressure vessel design.

Chapter 5 – Cargo Transfer

5.1.1 Piping classification standards are listed in 46 CFR 56.04 and piping design standards are listed in 46 CFR 56.07.

5.1.3 Flanges, valves, and fittings should meet applicable standards of the ASME.

5.2.1 Relaxations must be authorized by the USCG.

5.2.2 Exceptional cases should be authorized by the USCG.

5.2.3 Piping joint selection and limitations are listed in 46 CFR 56.30.

5.2.4 Bellows are not permitted.

5.2.5 Welding, post weld heat treatment and non-destructive testing standards are listed in 46 CFR 56.70, 56.85, and 56.95, respectively.

5.4.1 Relaxations must be authorized by USCG.

5.7 Hoses must have either full threaded connections; ANSI B16.2, 16.24, or B16.31 flanges; or Class 1 quick connect couplings that meet ASTM F1122 and marked “C1-1.” The hose should be marked with the date of manufacture and be in good condition (no loose covers, kinks, bulges, soft spots, or gouges/cuts which penetrate the hose reinforcement.) The hose should also be marked with the date of its last inspection, which should be conducted with the hose in a straight, flat, horizontal position and include a static pressure test at the maximum operating pressure.
Chapter 6 – Materials of Construction

6.1.1 Materials must meet ABS rules.

6.3 Prohibited materials. When one of the following paragraphs of this section is referenced in Table 1 of 46 CFR part 153, the materials listed in that paragraph may not be used in components that contact the cargo liquid or vapor:

(a) Aluminum or aluminum alloys
(b) Copper or copper alloys
(c) Zinc, galvanized steel or alloys having more than 10 percent zinc by weight
(d) Magnesium
(e) Lead
(f) Silver or silver alloys
(g) Mercury

Required materials. When one of the following paragraphs of this section is referenced in Table 1 of 46 CFR part 153, only those materials listed in that paragraph may be used in components that contact the cargo liquid or vapor:

(a) Aluminum, stainless steel, or steel covered with a protective lining or coating
(b) With cargo concentrations of 98 percent or greater, aluminum or stainless steel
(c) With cargo concentrations of less than 98 percent, 304L or 316 stainless steel
(d) Solid austenitic stainless steel
(e) Stainless steel or steel covered with a suitable protective lining or coating

Chapter 7 – Cargo Temperature Control

7.1.1 Construction, fitting and testing must comply with ABS rules.

Chapter 8 – Cargo Tank Vent Systems

8.3.4 High velocity vents must be approved in accordance with 46 CFR Subchapter Q.

8.3.5 Flame arresters installed on tanks should meet ASTM F-1273.

Chapter 10 – Electrical Installations

10.1.4 No electric motors may be installed in chemical tanks. Pump motor arrangements must provide for an automatic shutdown if the pump loses suction. A pump motor shutdown must actuate audible and visual alarms and either a lockable circuit breaker or lockable switch that disconnects power to the motor must be provided.

10.1.5 The National Electric Code, NFPA 70, Art. 500-504, shall be the standard of hazardous areas. Section I, Cites 4-8-3/13 and Section II, Cite: II-1/45 apply.

10.1.6 Electric motors are not permitted in the cargo area.
Chapter 11 – Fire Protection and Fire Extinction

11.2.2 Tankers carrying a restricted number of cargoes should not receive relaxations.

11.3.2 All foam concentrates shall be approved for the cargoes authorized to be carried.

11.3.7 Reduced monitor capacities for ships less than 4,000 DWT should be referred to USCG.

Chapter 12 – Mechanical Ventilation in the Cargo Area

12.2 No special requirements.

Chapter 13 – Instrumentation

13.2.3 Exemptions from toxic-vapor detection are only to be authorized by USCG.

Chapter 14 – Personnel Protection

14.1.2 Interpretation of the expression “adequate segregation” is left to the classification society, subject to USCG oversight.

Chapter 15 – Special Requirements

15.2.3 USCG only authorizes carriage of ammonium nitrate (93 percent or less) in tanks which have not contained other cargoes.

15.3.7 Cargo pump well shall extend to within 10 cm of tank bottom (46 CFR 153.520(a)).

15.5 Cooling systems, when fitted, should also be provided with leak detection systems.

15.6.3 USCG only authorizes entry into tanks which have not contained MFAK compounds.

15.7 Only the USCG can authorize carriage of molten phosphorous.

15.8.11 The materials listed are not acceptable under any circumstances.

15.8.22.2 The refrigeration requirements may not be waived.

15.8.25.2 Cargo handling plans are left to the classification society, subject to USCG oversight.

15.8.26.3 Cargo tank filling limits are left to the classification society, subject to USCG oversight.

15.8.29 The water spray shall operate automatically in a fire involving the cargo containment system, have at least two manual actuators, and have an application rate of 10.5 liters per square meter per minute.
15.12.1.4 High velocity vents must be approved in accordance with 46 CFR Subchapter Q.

15.14.3 No waivers will be granted for restricted operations.

15.19.7 ABS is authorized to act on behalf of the Administration.

Chapter 16 – Operational Requirements

16.2.2 USCG will review all cargoes which are mixtures.

16.5.1 Samples must be stored in the cargo area.

Chapter 16A – Additional Measures for the Protection of the Marine Environment

No special interpretations.

Chapter 17 – Summary of Minimum Requirements

For the purpose of material requirements, compliance with the special requirements in 46 CFR Part 153 of Table 1 of part 1 is required.

Chapter 18 – List of Chemicals to Which the Code Does Not Apply

No special interpretations.

Chapter 19 – Index of Products Carried in Bulk

No special requirements.

Chapter 20 – Transportation of Liquid Chemical Wastes

Transportation of liquid chemical wastes, although not generally permitted, require USCG authorization in concert with the US EPA.
VIII. IGC CODE SUPPLEMENTAL REQUIREMENTS

Unless otherwise noted below, ABS is authorized to interpret the expressions “left to the satisfaction of the Administration” and similar terms, in the IGC Code pertaining to the International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk. Carriage of chlorine is not permitted without the prior agreement of the USCG.

Chapter 1 – General

1.1.6 USCG acts only as a port administration for this requirement.

1.4 USCG acts as the Administration for this section.

1.5 USCG acts as the Administration for this section.

1.5.4.2 The Certificate of Fitness issued by ABS on behalf of the USCG will not include an asterisk against the ship type notation.

Chapter 2 – Ship Survival Capability and Location of Cargo Tanks

2.2.2 Intact stability shall also meet the requirements for gas carriers contained in 46 CFR 172.165, which states:

(a) Design calculations must show that 2 inches (50 mm) of positive metacentric height can be maintained by each tankship when it is being loaded and unloaded.

(b) For the purpose of demonstrating compliance with the requirements of paragraph (a) of this section, the effects of the addition of water ballast may be considered.

2.2.3 An acceptable method for determining free surface is contained in the 2008 IS Code.

2.9.1.3 Residual stability should not be less than the requirement in 2.9.2.1.

Chapter 3 – Ship Arrangements

3.1.1 Machinery spaces forward of the cargo area are not normally permitted.

3.3.1.1 Relaxation of the pump or compressor room location requirement is not permitted.

3.5.3.2.1 Relaxation of the access dimensions is not permitted.
3.8.1.1 Bow and stern unloading is not permitted for toxic products.

3.8.4 Relaxation of this section’s requirements is not permitted.

**Chapter 4 – Cargo Containment**

4.1 Cargo containment systems not previously accepted by the USCG will require USCG review and approval. A list of cargo containment systems currently accepted by the USCG may be obtained from Commandant (CG-522).

4.2.2.3 See Note concerning 4.1

4.2.4.2 Recognized standards are ABS Rules.

4.2.4.4 Type C tanks may only be allocated to Type B.

4.2.5.4 Internal insulation tanks shall not have a design vapor pressure greater than 0.7 bar.

4.2.6.4 Higher vapor pressures in port are subject to USCG approval.

4.2.7 Provisions to cover low temperature prevention are covered in Chapter 13.

4.3.2.1 Equivalent calculation procedures must be submitted to USCG.

4.3.4.3 Simplified loading spectra shall not be used.

4.3.4.5 No special consideration shall be given for restricted service.

4.4.1 Integral tanks must meet ABS Rules.

4.4.2.5 ABS SafeHull shall be used for structural analysis, and ABS Rules will be used for recognized standards.

4.4.4.1 ABS Rules will be used for recognized standards.

4.4.4.2 ABS Rules will be used for recognized standards.

4.4.5.5 Model tests will normally be required.

4.5.1.4 The value of A shall be 4.0 for all materials.

4.5.1.6 For type C tanks, the stress factor “A” must be taken as 4.0, regardless of the material type.

4.4.6 ASME Boiler and Pressure Vessel Code will be used as the acceptable standard, except as required otherwise.
4.4.7.2.1 ABS SafeHull will be used for structural analysis.

4.4.7.2.3 ABS Rules are the recognized standards

4.4.7.3 See Note on 4.1.

4.5.1.1 ABS Rules are recognized standards.

4.5.1.3 Acceptable stresses are those which agree with ABS Rules.

4.5.1.4 Vessels operating in US waters shall be designed with Stress factors IAW 46 CFR 154 Table 2.

4.5.1.5 As above.

4.5.1.7.2 Special consideration of improved tensile and yield properties must be demonstrated to the USCG.

4.5.1.10 Unspecified materials must be reviewed by USCG.

4.5.2.1 Corrosion allowances will be required for tanks that are not surrounded by inert gas or dry air or for corrosive cargoes. USCG will provide the values for these allowances upon request.

4.7.3 Semi-membrane tanks shall have a full secondary barrier.

4.7.7 Either a pressure/vacuum test or a visual test shall be specified.

4.8.1 The longitudinal contiguous hull structure of a vessel having cargo containment systems with secondary barriers must be designed for a temperature that is either:

(1) Colder that the calculated temperature of this hull structure when: (i) the temperature of the secondary barrier is the design temperature; and (ii) for operation anywhere except Alaskan waters, the ambient cold condition of (A) 5 knots air at -18ºC; and (B) still sea water at 0ºC; or (iii) for operation in Alaskan waters, the ambient cold condition of (A) 5 knots air at -29ºC; and (B) still sea water at – 2ºC; or (2) maintained by the heating system under 46 CFR 154.178.

4.8.4.4 In general, hull heating systems are not acceptable.

4.9.1 Recognized standards are ABS Rules, but vessels trading to the U.S. should have crack arresting steels in way of the deck stringer, shear strake, and turn of the bilge that meet the grades specified in 46 CFR 154.170(b).

4.9.8 Quality control of insulation is delegated, subject to USCG oversight.

4.10.1.2.1 Alternative edge penetrations are generally not permitted.
4.10.1.2.2 The ASME Code is the acceptable standard; other standards require USCG approval.

4.10.2 USCG should be contacted concerning workmanship. In general, tolerances shall be half of the ASME Code.

4.10.5.2 Sampling tests shall be according to ABS Rules.

4.10.6 Testing should be in accordance with ABS Rules for type A tanks, USCG requirements for type B tanks, and ASME Code requirements for type C tanks.

4.10.8.1 Recognized standards are ABS Rules.

4.10.8.2 Recognized standards are ABS Rules.

4.10.8.3 ABS tank testing rules are satisfactory to USCG.

4.10.9 ASME Code is the standard acceptable.

4.10.10.3.4 Hydro-pneumatic testing is not acceptable.

4.10.10.3.5 Higher stresses are not acceptable.

4.10.12 See Note concerning 4.7.7

4.10.13 Tanks constructed to the ASME Code do not need stress level confirmation.

4.11.1.4 Soaking should be according to the ASME Code.

4.11.2 Stress relief shall comply with the ASME Code.

4.11.2.14 Mechanical stress relief methods must be approved beforehand by USCG.

Chapter 5 – Process Pressure Vessels and Liquid, Vapor, and Pressure Piping Systems

5.1.2 Process pressure vessels shall meet the ASME Code.

5.2.2.1 Piping standards shall be as required by 46 CFR Subchapter F.

5.3.2.1 No higher or lower temperature may be specified.

5.3.2.2 No higher or lower temperature may be specified.

5.2.4.4 No lower design pressure may be accepted.

5.2.4.5 Flanges must comply with ASME B16.5.

5.2.5 Stress analysis is delegated to ABS subject to oversight by USCG.
5.3.2.2.2 In general, pressure tests need not be performed at the design temperature.

5.3.2.2.5 Performance of tests may not be waived.

5.4.2.3 Piping standards shall be as required by 46 CFR Subchapter F.

5.4.3 Alternative piping arrangements require USCG approval.

5.4.3.2 Flanges must comply with ASME B16.5.

5.4.6.2 Thermal stress relieving may not be waived.

5.4.6.3.1 Radiography may not be reduced.

5.5.1 No relaxations are permitted.

5.5.2 Alternative fluids must be liquids that have a flashpoint greater than 125°F.

**Chapter 6 – Materials of Construction**

6.1.3 Recognized standards are ABS Rules.

6.1.4.1 A Charpy V-Notch test is required.

6.1.4.2 Other tests may not be substituted for the Charpy V-Notch test.

6.1.4 Material properties must meet ABS Rules.

6.1.5 Alternative chemical properties are not acceptable.

Table 6.1 Footnotes – No special approval is permitted.

Table 6.2 Footnotes – No special agreement or approval is permitted.

Table 6.3 Footnotes – No special variations are permitted. Generally, charpy testing should be required.

Table 6.4 Footnotes – No special variations are permitted. Generally, charpy testing shall be required.

6.3.1 Testing may not be omitted. Generally, charpy testing should be required.

6.3.2 Welding consumables shall meet ABS Rules for type A tanks, USCG specifications for type B tanks, and ASME Code requirements for type C tanks. Welding tests may not be waived.

6.3.3.1 Radiography is required.
6.3.3.2.2 Transverse bend tests are at the discretion of the classification society.

6.3.3.2.4 Requirements for these tests are left to the discretion of the classification society.

6.3.4.2 No special agreement is permitted.

6.3.4.3 Recognized standards for this section will be individually reviewed.

6.3.5 Test requirements should be in accordance with 6.3.4.

6.3.6.1 A reduction in test for secondary barrier is not acceptable.

6.3.6.2.2 USCG will consider alternatives to the energy requirements, on a case-by-case basis.

6.3.6.3 USCG will consider alternatives to the energy requirements, on a case-by-case basis.

6.3.6.4 Integral and membrane tests must be inspected according to USCG approved standards available from the manufacturer.

6.3.7.1.2 Tank examination will be as approved by USCG for the tank designed.

6.3.7.1.3 ABS Rules shall be the recognized standards, except that for membrane tanks, the USCG accepted manufacturer’s procedures shall be used.

6.3.7.3 See Note for 6.3.7.1.3.

Chapter 7 – Cargo Pressure/Temperature Control

7.1 Refrigeration systems shall meet 46 CFR 154.702. Stand-by unit is required. Unless refrigeration system is installed, cargoes with a vapor pressure exceeding the MARVS at 45°C are not authorized in US Waters

7.1.1 Design of cargo pressure and temperature control must contain cargo for 21 days, and cargo venting cannot be used to control tank pressure while in U.S. ports.

7.1.2 Special design ambient temperatures apply for Alaskan waters, as given in 46 CFR 154.176.

Chapter 8 – Cargo Tank Vent Systems

8.2.2 Pressure/vacuum relief is delegated to ABS, subject to USCG oversight.

8.2.5 ABS is the acceptable authority.

8.2.7 Changing of relief valve settings will be overseen by a surveyor of ABS.
8.2.10  No relaxation of this requirement is accepted for ships less than 90 m.

8.4.2.3  Other vacuum relief systems must be handled under the conditions of 1.4.

8.5.2   Approval for F=0.5 is delegated to the ABS, subject to USCG oversight.

**Chapter 9 – Environmental Control**

9.5.2   A check valve is an acceptable means.

**Chapter 10 – Electrical Installations**

The National Electric Code, NFPA 70, Art. 500-504, shall be applied.

10.1   The applicable standards of Section I, Cite: 4-8-3/13; Section II, Cite: II-1/45; and IEC 92-502 (1980) apply.

**Chapter 11 – Fire Protection and Fire Extinction**

11.3.4  When the fire main pumps are used to supply the water spray system, the fire main must still be able to operate at full capacity.

11.4.3  ABS is delegated to accept standards for ships with a capacity less than 1,000 cubic meters.

11.4.4  Suitable alternatives will be considered according to 1.4.

11.5.2  Relaxations are not permitted for ships carrying a restricted number of cargoes.

**Chapter 12 – Mechanical Ventilation in the Cargo Area**

12.1.5  Positive pressure ventilation is not acceptable.

**Chapter 13 – Instrumentation (Gauging, Gas Detection)**

13.1.4  Testing intervals and procedures are delegated to ABS, subject to USCG oversight. Vessels in U.S. ports should be able to demonstrate that the instruments function, and in the case of gas detection, that they are properly calibrated.

13.2.4  Gauge glasses need USCG approval, but are generally not acceptable.

13.3.1  USCG should be contacted in the case that it is the port authority. Sensors required for automatic closing of the shut-off valve for overflow controls as specified by 13.3.1 and the liquid level as specified by 13.2.1 must be independent of each other, however, the sensors may send signals to the same actuator.
13.5.4 Temperature sensors should be at the bottom of the tank and near the top of the tank, below the maximum filling level.

13.6.1 Gas detection is delegated to ABS, subject to USCG oversight.

13.6.11 Other limits are not acceptable.

13.6.13 Portable gas detectors should meet the thresholds specified by OSHA.

**Chapter 14 – Personnel Protection**

14.2.4 The provisions of this paragraph are not acceptable.

14.4.5 This requirement is delegated to ABS, subject to USCG oversight.

**Chapter 15 – Filling Limits for Cargo Tanks**

15.1.3 Higher filling limits are permitted IAW Resolution A.829(19).

15.2 The approval of this list is delegated without restriction.

**Chapter 16 – Use of Cargo as Fuel**

16.5.2 This requirement is delegated to ABS, subject to USCG oversight.

16.5.6 This requirement is delegated to ABS, subject to USCG oversight.

16.6 This requirement is delegated to ABS, subject to USCG oversight.

**Chapter 17 – Special Requirements**

17.1 Carbon Dioxide is not permitted in US Waters.

17.14 Chlorine may not be carried in U.S. waters.

17.18.3 Other compositions require USCG approval.

17.19 Nitrogen cargo carriage requires special USCG approval.

Methyl acetylene propadiene mixtures (MAPP gas) shall be carried only in one of the two compositions specified in the applicable Gas Code.

17.20 Propylene oxide may be authorized for carriage subject to the following special restrictions:

(1) Classification society certification that the required cargo piping separation has been achieved must be on board the vessel and available to Coast Guard boarding personnel.
(2) All gaskets which may contact propylene oxide liquid or vapor must be constructed from spirally wound stainless steel with a filler of Teflon or similar fluorinated polymer.

(3) Neoprene, natural rubber, asbestos mixed with other materials, and materials containing oxides of magnesium (such as mineral wools) may not be used for packing, insulation and similar items in the propylene oxide containment system and piping.

The following requirements apply to the carriage of ethylene oxide/propylene oxide mixtures (containing a maximum of 30% ethylene oxide):

(1) The requirements for propylene oxide given above must be followed.

(2) When this cargo is carried without refrigeration the cargo tank relief valve setting shall not be less than 120 kPa gauge (17 psig).

17.20.3.1 Only steel or stainless steel are acceptable.

17.20.13.2 The approval of handling plans is delegated to ABS.

17.20.14 The approval of filling limits is delegated to ABS.

17.21 Operational requirements for the carriage of Vinyl Chloride:

Fixed or portable instruments shall be used to continuously monitor for vinyl chloride vapor leaks during vinyl chloride transfer operations. The method of monitoring and measurement shall have an accuracy (with a confidence level of 95 percent) of not less than ± 50 % from 0.25 through 0.5 ppm, ± 35% from over 0.5 ppm through 1.0 ppm, and ± 25% over 1.0 ppm;

Cargo transfer operation is discontinued or corrective action is initiated by the person in charge to minimize exposure to personnel whenever a vinyl chloride vapor concentration in excess of 1 ppm is detected. If the vinyl chloride vapor concentration exceeds 5 ppm for over 15 minutes, action to reduce the leak can be continued only if the respiratory protection requirements of 29 CFR 1910.1017 are met by all personnel in the area of the leak;

Those portions of cargo lines which will be open to the atmosphere after piping is disconnected are free of vinyl chloride liquid and the vinyl chloride vapor concentration in the area of the cargo piping disconnect points is not greater than 5 ppm;

Any restricted gauge fitted on a tank containing vinyl chloride is locked or sealed so that it cannot be used and a restricted gauge is not used as a check on the required closed gauge, nor as a means of sampling;
The words “CANCER-SUSPECT AGENT” are added to the warning signs required by 46 CFR 154.1830, and signs bearing the legend: “CANCER-SUSPECT AGENT IN THIS AREA, PROTECTIVE EQUIPMENT REQUIRED, AUTHORIZED PERSONNEL ONLY” are posted whenever hazardous operations, such as tank cleaning, are in progress;

A vessel undergoing cargo transfer operations be designated a “regulated area” having access limited to authorized persons and requiring a daily roster of authorized persons who may board, and;

Employees engaged in hazardous operations, such as tank cleaning, be required to wear and use respiratory protection in accordance with the provisions of 29 CFR 1910.1017 and protective garments, provided clean and dry for each use, to prevent skin contact with liquid vinyl chloride.

Chapter 18 – Operating Requirements

No special requirements.

Chapter 19 – Summary of Minimum Requirements

No special requirements.
IX. REQUIREMENTS FOR OFFSHORE SUPPLY VESSELS
CERTIFICATED UNDER SUBCHAPTER L, EXCEPT LIFTBOATS

Scope: This section specifies additional or different requirements that apply to Subchapter L OSV’s (except liftboats) certificated under Subchapter L enrolled or to be enrolled in the Alternate Compliance Program.

Note: Subchapter L “Liftboats” is not included in this Section.

In addition to Section I/Cite: 3-3-1/3.1 for intact stability, OSV’s are also to comply with the subdivision and damage stability requirements contained in either (a) IMO Res. MSC.235(82), section 3, or (b) 46 CFR 174.195, 174.200, 174.205, and 174.207.

Note: Provisions for the carriage of noxious liquid substances in bulk as defined in MARPOL Annex II may be augmented by appropriate measures promulgated by the Commandant.

An OSV may carry the following in integral tanks:

In addition to the requirements of the Steel Vessels Rules and this Supplement, the electrical installation on an OSV carrying flammable or combustible liquids in bulk must comply with the CG-522 Policy Letter 09-01 “POLICY ON THE IMPLEMENTATION OF RESOLUTION A.673(16), GUIDELINES FOR THE TRANSPORT AND HANDLING OF LIMITED AMOUNTS OF HAZARDOUS AND NOXIOUS LIQUID SUBSTANCES IN BULK ON OFFSHORE SUPPORT VESSELS, FOR NEW AND EXISTING U.S. OFFSHORE SUPPLY VESSELS” dated 05 April 2010. See Cite II-1/45 of Section II.A.

Cargo Gear is to be certified in accordance with the ABS “Requirements for Certification of Construction and survey of Cargo Gear on Merchant Vessels”, 1975 or the Guide for Certification of Cranes, 1991 as applicable for the type of cargo gear being provided.

As an alternative, evidence of approval by the International Cargo Gear Bureau may be submitted.
Offshore worker means an individual carried aboard an OSV and employed in a phase of exploration, exploitation, or production of offshore mineral or energy resources served by the vessel; but it does not include the master or a member of the crew engaged in the business of the vessel, who has contributed no consideration for carriage aboard and is paid for services aboard. In no case will the number of offshore workers authorized for carriage exceed 36.

No more than 12 offshore workers may be carried aboard an OSV when on an international voyage, unless the vessel holds a valid passenger-ship-safety certificate issued in compliance with the International Convention for the Safety of Life at Sea, 1974, as amended.

Cite: A-6 Means of Escape

(a) A vertical ladder ending at a deck scuttle may be the second means of escape if the:

(1) primary means of escape is a stairway or passageway;
(2) installation of another stairway or passageway is impracticable;
(3) scuttle is located where stowed deck cargo could not interfere;
(4) scuttle is fitted with a quick-acting release, and with a hold-back device to hold it open; and
(5) scuttle meets the requirements for location, strength, and height of coaming in the International Convention on Load Lines.

(b) Each vertical ladder must:

(1) Have rungs that are:
   (i) at least 410 mm (16 in) long;
   (ii) at most 300 mm (12 in) apart, uniform for the length of the ladder; and
   (iii) at least 180 mm (7 in) from the nearest permanent object in back of the ladder;
(2) Have at least 115 mm (4-1/2 in) of clearance above each rung;
(3) Be made of incombustible materials; and
(4) Have an angle of inclination with the horizontal, greater than 70° but not more than 90°.

(c) No means may be provided for locking any interior door giving access to either of the two required means of escape, except that a crash door or locking-device, capable of being easily forced in an emergency, may be employed if a permanent and conspicuous notice to this effect is attached to both sides of the door. A means may be provided for locking an exterior door to a deckhouse if the door is:

(1) Locked only by a key under the control of one of the OSV’s officers; and
(2) Always operable from the inside.

Cite: A-7 Accommodations for Crew Members and Offshore Workers

The following requirements apply to accommodations for offshore workers on each vessel:

(1) Each offshore worker aboard must be provided with adequate fixed seating. The width of each seat should be at least 460 mm (18 in). The spacing of fixed seating must be
sufficient to allow ready escape in case of fire or other emergency. The following are minimal requirements:

(i) aisles 4.6 m (15 ft) in length or less must not be less than 610 mm (24 in) wide.
(ii) aisles more than 4.6 m (15 ft) in length must not be less than 760 mm (30 in) wide.
(iii) where the seating is in rows, the distance from seat front to seat front must not be less than 760 mm (30 in).

(2) If the intended operation of a vessel is to carry offshore workers aboard for more than 24 hours, quarters for them must be provided. Each stateroom for use by them must:

(i) berth no more than six workers;
(ii) have clear headroom of at least 1.9 m (6 ft 3 in); and
(iii) contain at least 1.9 m² (20 ft²) of deck and at least 4 m³ (140 ft³) of space for each worker accommodated. The presence in a stateroom of equipment for use by the occupants does not diminish the area or volume of the room.

(3) There must be at least one toilet, one washbasin, and one shower or bathtub for every eight or fewer offshore workers who do not occupy a stateroom to which a private or a semiprivate facility is attached.

OSV’s are not required to be outfitted with a Hospital Space required by Section III Cite B.8 of the U.S. Supplement.

Cite: A-8 Keel Cooler Installations

Fillet welds may be used in the attachment of channels and half-round pipe sections to the bottom of the vessel.

Cite: A-9 Liquid-Mud Systems

Liquid-mud piping systems may use resiliently seated valves of Category A to comply with Cite 4-4-2/11 of this Supplement.

Cite: A-10 Dual-Voltage Generators

If a dual-voltage generator is installed on an OSV the neutral of the dual-voltage system must be solidly grounded at the switchboard’s neutral bus and be accessible for checking the insulation resistance of the generator.

Cite: A-10a Grounded Distribution System

If a grounded distribution system is provided, there must be only one connection to ground, regardless of the number of power sources.
Cite: A-11 Automation of Unattended Machinery Spaces

OSV’s intended to operate with periodically unattended machinery spaces are to comply with the class requirements for class notation ACCU as well as other applicable requirements of this Supplement.

Cite: A-15 Fire Stations

Each outlet at a fire hydrant must be at least 38 mm (1-1/2 in) in diameter and, to minimize the possibility of kinking, must be fitted so that no hose leads upward from it.

Each fire hydrant must have a fire hose 15.2 m (50 ft) in length, with a minimum diameter of 38 mm (1-1/2 in), connected to an outlet, for use at any time.

A suitable hose rack or other device must be provided for each fire hose. Each rack on a weather deck must be placed so as to protect its hose from heavy weather.

Cite: A-16 Fire Monitors

When a fire monitor is connected to the fire main system, it must be led from the discharge manifold of the fire pump. Each fire monitor must be fitted with a shut-off valve at the monitor and at the connection to the fire pump discharge manifold.

VIII. REQUIREMENTS FOR OCEANOGRAPHIC RESEARCH VESSELS CERTIFICATED UNDER SUBCHAPTER U

Cite: B-1 Subdivision and Stability

1) Each oceanographic research vessel must meet the subdivision and damage stability requirements of 46 CFR Part 173, Subpart D (www.access.gpo.gov/nara/cfr/waisidx_08/46cfr173_08.html) and SOLAS Chapter II-1 cargo ship requirements.

2) In lieu of the requirement of paragraph 1), an oceanographic research vessel may comply with SOLAS chapter II-1 passenger ship requirements.

Cite: B-2 Lifesaving Appliances and Arrangements

1) Lifesaving appliances and arrangements on oceanographic research vessels are to meet the SOLAS/ACP Supplement requirements for passenger vessels as follows:
   A. Vessels that carry more than 50 special personnel.
   B. Vessels that carry not more than 50 special personnel that meet the structural fire protection regulations for passenger vessels of same size.

2) Lifesaving appliances and arrangements on oceanographic research vessels that carry not more than 50 special personnel that do not meet the structural fire protection regulations for passenger vessels of same size are to meet the SOLAS/ACP requirements for cargo vessels.

Cite: B-3 Means of Escape

There shall be two means of escape from all general areas where scientific personnel may be quartered or normally employed and from each public space with a deck area greater than 300 ft². At least one of these two means of escape shall be independent of watertight doors and hatches, except for quick acting watertight doors giving final access to weather decks.

Cite: B-4 Structural Fire Protection

Oceanographic research vessels that carry more than 150 persons must meet the structural fire protection requirements in SOLAS/ACP Supplement for Passenger vessels as applicable to passenger ships carrying more than 36 passengers.

Cite: B-5 Structural Fire Protection – General Laboratory Areas and Chemical Storerooms

1) Laboratories and chemical storerooms shall be considered as “service spaces” for the application of SOLAS chapter II-2.

2) Boundary bulkheads shall be of “A” class construction; however, if constructed in other than steel, shall be wholly lined with metal. Refer to 190.05-10 for similarity.

3) Divisional bulkheads that are permanently installed between laboratory spaces within a general laboratory may be of “B” or “C” class construction.
4) Divisional bulkheads temporarily installed between laboratory spaces within a general laboratory area may be constructed of combustible materials when they are necessary to facilitate a specific scientific mission.

5) Boundary bulkheads and decks separating general laboratory areas of 152 m² (500 ft²) or less from accommodations and control stations shall be of “A-15” class construction.

6) Boundary bulkheads and decks separating general laboratory areas of over 152 m² (500 ft²) from accommodations and control stations shall be of “A-30” class construction.

7) Furnishings and equipment which are permanently installed in laboratories, such as desks, file and storage cabinets, waste paper baskets, work benches, chair frames, etc. are to be constructed of noncombustible materials, in so far as reasonable and practicable. Working surfaces where chemical stores are used shall be of noncombustible material.

8) Furnishings and equipment temporarily installed to facilitate a specific scientific mission or used for working surfaces other than chemical stores may be of combustible materials.

9) Equipment installed in chemical storerooms, such as shelves and cabinets shall be constructed of noncombustible materials.

10) If the vessel is certificated to carry more than 150 persons, laboratories and chemical storerooms must be considered as type (14) spaces, and the boundary bulkheads must meet the requirements of SOLAS regulation II-2/9.2.2.3 in lieu of the requirements of items 1) through 6) of this cite.

11) Shelving must be constructed so as to provide a clear space of at least 102 mm (4 in) between the bottom shelf and the deck.

Cite: B-6 Structural Fire Protection- Integral Magazines

Bulkheads and decks of integral magazines that are common with storerooms or workshops shall be of “A-15” construction. Flush constructions shall be used where practicable.

Cite: B-7 Segregation of Chemical Laboratories and Chemical Storerooms

1) Chemical storerooms shall not be located in horizontal proximity to nor below accommodation or safety areas.

2) Chemical storerooms shall not be located adjacent to the collision bulkhead, nor boundary divisions of the boiler room, engine room, galley or other high fire hazard area.

3) Chemical laboratories shall not be located adjacent to nor immediately below safety areas. Whenever possible, they shall be similarly separated from accommodation spaces and high fire hazard areas such as the galley.

4) Access doors shall be labeled “Scientific Laboratory,” “Chemical Laboratory” or “Chemical Storeroom” in Red or White 3 inch Block type letters.

Cite: B-8 Construction and Location of Integral Magazines

1) Integral magazines shall be of permanent watertight construction located below the freeboard deck and where practicable below the waterline.

2) Magazines shall not be located in horizontal proximity to or below accommodation spaces.

3) Magazines shall not be located adjacent to the collision bulkhead, nor in bearing with the bulkhead forming the boiler room, engine room, galley, or other high fire hazard area boundary. If necessary to construct the magazine in proximity of these areas, a cofferdam
space of at least 0.61 m (2 ft) shall be provided between the bulkhead or deck involved and the magazine. Such a cofferdam shall be provided with suitable ventilation and shall not be used for storage purposes.

4) Access doors to magazines shall be of watertight construction, provided with means of locking and shall be labeled “Magazine” “Keep Open Lights and Fire Away” “Keep Door Closed” “Remove Matches and Lighters Prior to Entering” in Red or White 3 inch Block type letters.

5) Racks, stanchions, battens, and other devices must be installed in the magazine to provide rigid and safe stowage of explosives.

Cite: B-10 Deck Covering for Chemical Storerooms and Laboratories

In chemical storerooms and in laboratories where chemicals will be commonly used, the deck shall be of nonskid material suitably resistant to chemical spills with provisions to contain and remove chemical spills.

Cite: B-11 Deck/Shell Covering for Integral Magazines

1) Decks shall be covered with a permanent non-slip, non-spark covering.
2) Noncombustible thermal insulation shall be installed on shell and unsheathed weather decks that form boundaries of magazine spaces to prevent condensation of moisture.
3) Tank tops that form the magazine deck shall be insulated with an approved deck covering to prevent condensation of moisture. Tank top manholes shall not be installed in magazines.

Cite: B-12 Ventilation Systems for Chemical Storerooms and Chemical Laboratories

1) Exhaust type power ventilation system shall be installed which has a capacity sufficient to effect a complete change of air in not more than 4 minutes based on volume of compartment.
2) Power ventilation units shall have non-sparking impellers and shall not produce a source of vapor ignition in either the compartment or the ventilation system associated with the compartment.
3) System shall be independent of any other ventilation system, serve no other space in vessel and be of watertight construction.
4) Controls for the power ventilation shall be conveniently located and marked to clearly identify the purpose of control.
5) Ventilation exhaust outlets shall terminate more than 1.8 m (6 ft) from any opening to the interior part of the vessel and from any possible source of vapor ignition.
6) Chemical storerooms shall comply with the following additional requirements:
   a. Vent inlets to exhaust ducts shall be provided and located at points where concentration of vapors may be expected.
   b. Terminals of vents shall be fitted with flame screens.
   c. Provisions shall be made so that the storeroom is ventilated prior to entry including an indicator outside the space to show that ventilation is being provided and, in addition, the storeroom shall be marked “Danger-Ventilate Before Entering”
7) Chemical laboratories shall comply with the following additional requirements:
   a. Ventilation system must serve the entire laboratory so that same may be used in event of spills or other emergencies.
   b. Power ventilation system shall be interlocked with any other ventilation or air conditioning system serving the laboratory to prevent circulation of vapors to other spaces.
   c. Ventilation of air conditioning systems shall be designed so that air cannot be recirculated into an accommodation space.
   d. Suitably installed fume hood equipped with independent power exhaust ventilator shall be provided for any operations, reactions or experiments which produce toxic, noxious or corrosive vapors. Fume hood vent shall be compatible with laboratory ventilation to prevent fumes from backing-up within the fume hood system and shall terminate so as to prevent fumes from entering other portions of vessel. Terminals of vents shall be fitted with flame screens.

Cite: B-13 Ventilation Requirements for Integral Magazines

1) Natural or mechanical ventilation shall be provided with sufficient capacity to maintain the magazine temperature below 37.8° C (100° F) with 31.1° C (88° F) weather air. Mechanical cooling may be used where ventilation requirements exceed 1,500 cubic feet per minute.
2) Vent systems shall be of watertight construction, serve no other space and be provided with metal watertight closures for use when system is not in use.
3) Weather cowls shall be provided with a double layer of wire screen not less than 1/8” mesh.
4) To prevent pressure build up, a 2 inch IPS bypass with check valve shall be provided in parallel with at least one of the vent closures.

Cite: B-14 Piping and Electrical Requirements for Chemical Storerooms

1) Piping systems or similar arrangements are not permitted for the transfer of chemical stores between a storeroom and the area in which chemical stores are used.
2) Piping, electrical equipment and wiring shall not be installed within or pass through the storeroom except as required for storeroom itself.
3) Electrical installations must comply with requirements for hazardous areas – Class I, Division 1, Group C.

Cite: B-15 Electrical Requirements for Chemical Laboratory

Electrical installations located within 457 mm (18 in) of the deck of the laboratory must comply with the requirements for hazardous areas-Class I, Division 2.

Cite: B-16 Electrical Requirements for Integral Magazines

1) Light fixtures shall be of an approved type fitted with globes and guards.
2) Controls of the lighting system shall be from a location outside the magazine with an indicator light provided at the switch location to show when lighting circuits are energized.
3) Other electrical equipment and wiring must not be installed within or pass through the magazine.  
4) Electrical cables enclosed in a watertight trunk are permitted.

Cite: B-17 Flushing System for Chemical Storerooms and Laboratories

1) Provisions shall be made for flushing away chemical spills.  
2) Working spaces in which chemical stores are used shall be equipped with fresh water supply shower.  
3) If a drainage system is installed, it shall be separate from any other drainage system.

Cite: B-18 Piping Systems for Integral Magazines

The only piping allowed, other than piping required for magazine itself, within or passing through magazine is as follows:

1) Fresh and salt water service piping and drainage system may be routed through magazines.  
2) Other piping systems enclosed in watertight trunk.

Cite: B-19 Fire Extinguishing System for Magazines

Sprinkler system shall be installed in each magazine or magazine group.

1) System shall be manual control, hydraulic control or automatic and shall be remotely operable from a control station on the freeboard deck and manually operable at the control valve location. Control Valve shall be in general accordance with Spec. MIL-V-17501.  
2) Automatic type systems shall have sprinkler head of the open head design to permit either manual or automatic operation.  
3) System designs shall be based on minimum total system capacity of 0.8 gallons per minute per square foot of overhead area.  
4) Vessel fire pump may be used if sprinkling system shall not interfere with simultaneous use of fire main.  
5) Control locations for sprinkler system shall be labeled “MAGAZINE SPRINKLER CONTROL”

Cite: B-20 Firemain

Sufficient number of hose streams must be immediately available from the firemain at all times by either of the following methods:

1) Maintain water pressure on firemain by continuous operation of:  
   a. One fire pump, or  
   b. A suitable pump capable of supplying one hose stream at pitot tube pressure of not less than 3.45 bar (50 psi), or  
   c. Pressure tank capable of supplying one hose stream at pitot tube pressure of not less than 3.45 bar (50 psi) for five minutes.
d. An audible alarm must be installed in continuously manned space to sound if pressure of firemain drops to less than necessary to maintain minimum pitot tube pressure.

2) Remote activation and control of one fire pump
a. If fire pump is in continuously manned space, remote controls for pump and all necessary valves must be located at manned operating platform.

b. If fire pump is in an unmanned machinery space, remote controls for pump and all necessary valves must be located in:
   1. Fire control station, if any
   2. Navigation bridge, or
   3. Readily accessible space acceptable to OCMI.

Cite: B-21 Fire Hydrants and Hose

If nozzles are provided that accept low velocity water spray applicators, a low-velocity water spray applicator must be installed in way of at least one length of fire hose on each fire hydrant outside and in the immediate vicinity of each laboratory.

Cite: B-22 Fixed Fire Suppression System

A USCG Type Approved Fixed Fire Suppression System (carbon dioxide or clean agent) shall be installed in all chemical storage areas. The system shall be capable of automatic activation.

Cite: B-23 Portable Fire Extinguishers

One dry chemical and one carbon dioxide C-II Type portable fire extinguisher must be installed in each chemistry laboratory, scientific laboratory and chemical storeroom for each 27.9 m² (300 ft²) or fraction thereof, as well as one of each kind located in vicinity of the exit of same.

Cite: B-24 Hazardous Materials and Explosives

Oceanographic research vessels shall comply with detailed requirements of 46 CFR Part 194 for stowage, labeling, handling, use, and control of explosives and other hazardous materials. http://www.access.gpo.gov/nara/cfr/waisidx_08/46cfr194_08.html

Cite: B-25 Explosive Handling Plan

a) It shall be the responsibility of the master to have prepared, signed, and prominently posted in conspicuous locations, operating procedures, plans, and safety precautions for all operations involving the use of explosives.

b) The operating procedures referred to in paragraph (a) of this section shall include and set forth the special duties and stations of appropriate qualified persons for various operations involving the use of explosives. Assignment of such persons shall be commensurate with their experience and training.

c) A copy of the operating procedures, plans and safety precautions required by paragraph (a) of this section and all subsequent changes or revisions shall be forwarded to the Officer in Charge, Marine Inspection, issuing the certificate of inspection for review.
Cite: B-26  Magazine Vans and Magazine Chests

1) Magazine vans and magazine chests carried on oceanographic research vessels shall meet the arrangement, construction, stowage, labeling, ventilation and fire protection system-sprinkler system requirements of 46 CFR Subpart 194.10
   http://www.access.gpo.gov/nara/cfr/waisidx_08/46cfr194_08.html
2) Magazine vans are subject to normal plan submission procedures and initial construction inspection.

Cite: B-27  Portable Vans and Tanks

1) Portable vans and tanks, including temporary structures, which may be carried on oceanographic research vessels shall meet the design, construction, stowage and labeling requirements of 46 CFR Subpart 195.11:
   http://www.access.gpo.gov/nara/cfr/waisidx_08/46cfr195_08.html
2) Accommodation, power and chemical stores vans are subject to normal plan submission procedures and initial and periodic inspection.

Cite: B-28  Weight Handling Gear

1) Weight handling gear installed on an oceanographic research vessel, with the exception of gear for lifesaving equipment, shall be certified in accordance with the ABS “Guide for the Certification of Lifting Appliances” as appropriate for the type of weight handling gear provided.
2) As an alternative, evidence of approval by the International Cargo Gear Bureau may be submitted.

Cite: B-29  Fire Axes

Each vessel must carry at least the number of fire axes as shown in the table below and these must be distributed throughout the spaces available to persons on board to be readily available in case of emergency.

XI. GUIDANCE AND REFERENCES

USPHS (Application of PHS Publication No. 393)

Reference 1  (Note: For information only; USCG and Class have no requirements or involvement; see below how PHS 393 applies to U.S. Flag.)

A. The ship must meet the definition of “vessel” in Section 1250.3(m) of Title 21 of the Code of Federal Regulations (21 CFR 1250.3(m)): Any passenger-carrying, cargo, or towing vessel exclusive of:

(1) fishing boats including those used for shell-fishing
(2) tugs which operate only locally in specific harbors and adjacent waters
(3) barges without means of self-propulsion
(4) construction-equipment boats and dredges, and
(5) sand and gravel dredging and handling boats”

The “PHS-393” USPHS/FDA Handbook on Sanitation of Vessel Construction applies to U.S. flagged conveyances that meet the “vessel” definition and operate in “interstate traffic” as defined in 21 CFR 1250.3(h) in B. below. Inspection and vessel blueprint review is done at the discretion of the FDA district office where the shipyard is located or the headquarters office of the vessel owner/operator is located depending on available resources.

Location of the appropriate FDA district office may be found at the following web address: http://www.fda.gov/ora/inspect_ref/iom/iomoradir.html#orafield.

B. In order to fall under FDA jurisdiction the ship must operate in “interstate traffic” as defined in 21 CFR 1250.3(h): “The movement of any conveyance or the transportation of persons or property, including any portion of such movement or transportation which is entirely within a state or possession (i) from a point of origin in any state or possession to a point of destination in any other state or possession, or (ii) between a point of origin and a point of destination in the same state or possession but through any other state, possession or contiguous foreign country.” There are certain exclusions that apply to this definition.

C. USPHS Handbook on Sanitation apply to U.S. flagged vessels that meet the “vessel” and “interstate traffic” requirements and the following kind of documents are to be submitted to the appropriate FDA office:

Blueprints, sketches, and specifications of the following areas are usually needed:

(1) General Plan – Inboard and Outboard Profiles
(2) Deck by deck layout showing all spaces
(3) Layouts of all food spaces includes galleys, pantries, bell boxes, dining areas, lounges, bars, dry provisions rooms, walk-in refrigerators and freezers, thaw
rooms, all other food preparation, service and storage rooms, garbage handling room, trash incineration rooms, etc. showing location of food service equipment

(4) Book of food service equipment specifications for all food spaces with model number, manufacturer’s name and address, pictures, sketches

(5) Diagram and drawings of potable water system showing locations of sea chests, evaporators, RO devices, tanks, chlorinators, chlorine analyzers, service outlets, backflow preventers, etc.

(6) Lists of backflow preventers and where used in the potable water system as well as a specification sheet for each kind of backflow preventer.

(7) Operator’s manuals and specification sheets for potable water evaporators and reverse osmosis equipment

(8) Diagrams and specifications for all pools and spas showing water supply, overflow scuppers, drains, drain piping, backflow preventers

(9) Specification sheets for marine sanitation devices and sewage holding tanks with IMO/USCG specification numbers

(10) Diagram showing location of all overboard discharges for the sewage system

(11) Black water system drawings

(12) Grey water and plumbing drains drawings

(13) Sketch of air handling units in AC/fan rooms showing inspection ports and access for cleaning (for passenger vessels)

D. Contact the appropriate FDA district office to set up inspections.

</table>
4/11.7.6 Cite revised to indicate minimum restoration period for standby and 4/11.9.5 electric power for U.S. flag vessels.

5/2A.1.1.7 Updated cite to indicate USCG approval for high velocity vent valves. Additionally, required approval for pressure vacuum valves clarified.

5/4A.5.1 Updated cite to indicate that safety relief valves for liquefied compressed gas service are to be USCG approved. Additionally, required approval for cargo containment systems and piping systems carrying nitrogen clarified.

5/5.27 New cite addressing sprinkler systems for passenger vessels.

Section II Nov. 1, 1999
General Revised to reflect USCG policy for acceptance of fire suppression and detection equipment under ACP.

II-2/4.7.2 Cite revised to clarify hydrant and hose arrangements.

II-2/4.8.4 Cite revised to clarify required approval for nozzles.

II-2/5 Cite revised to clarify required approval for fixed gas extinguishing systems.

II-2/6 Cite revised to clarify required approval for fire extinguishers.

II-2/7 Cite revised to clarify fire detection and fire-extinguishing requirements for incinerator spaces.

II-2/12 Cite revised to indicate requirement for sprinkler systems to comply with NFPA 13.

II-2/13 Cite revised to eliminate the battery capacity requirements as USCG requirements were harmonized with SOLAS. Additionally, cite was revised to clarify required approval for fixed fire detection and alarm systems.

II-2/61 Cite revised to clarify required approval for fixed foam systems.

Section III Nov. 1, 1999
U. S. Supplement

Section XII

C  New cite addressing requirement for ventilation of passenger spaces.

33 CFR 155.380 New cite added to clarify approval requirement for pollution equipment.

33 CFR 157.12 New cite added to clarify approval requirement for pollution equipment.

33 CFR 157.15 New cite added to clarify approval requirement for pollution equipment.

33 CFR 159 Cite revised to clarify requirements for MSDs.

Section IV  Nov. 1, 1999

Check Sheets for Surveys After Construction updated.

Section V  Nov. 1, 1999

New Construction Survey Check Sheet updated.

Introduction  Jan. 1, 2002

Revised applicability criteria for Supplement; i.e., Item F regarding Automation deleted – see Cite 4-9-1/1.

Section 1  Jan. 1, 2002

General  Cite references in the Table of Contents revised to agree with the 2002 Edition of the Steel Vessels Rules.

4-8-3/9  First paragraph following Demand Load Table revised to reflect USCG acceptance of IEC 92-350 series cables.

4-8-4/27  First paragraph revised to clarify that either NEC or IEC standards for installations in hazardous areas may be followed; i.e., it is not necessary to comply with both.

4-9-1/1  New cite to clarify automation requirements by basing the criteria on the level of manning intended for the propulsion machinery space.

4-9-3/1, 4-9-3/3, 4-9-3/9 & 4-9-3/15.5.1 New cites providing additional USCG requirements which supplement ABS ACC requirements.

4-9-3/15.5.2 Cite revised to include additional USCG requirements for fire pump control and pressure monitoring. Also made applicable for ACC.
6/5.5 (PVG)  Cite revised to make reference to the ABS Passenger Vessel Guide.

Section II  Jan. 1, 2002
II-2/4.7.2  Cite revised to clarify that for hydrants using a Siamese connection only one hose will be required for the station to agree with USCG requirements.

II-2/5.2  Requirement addressing release time for CO2 system deleted as it is not applicable to cargo spaces and the machinery space requirement is covered by SOLAS.

II-2/12  Cite revised to clarify that compliance with SOLAS and NFPA 13 required with the higher standard prevailing.

VI 6.1 & VI 6.1.2.8 (LSA Code)  Cites III/48 and III/48.2 revised to reflect SOLAS Amendment creating the LSA Code.

Section III  Jan. 1, 2002
B.6(m)  Deleted as the requirement for open front toilet seat is no longer in CFR.

Section VI  Jan. 1, 2002
III/21  Regulation number of Cite III/20 changed to III/21 per SOLAS Amendments.

III/22  Regulation number of Cite III/21 changed to III/22 per SOLAS Amendments.

III/22.3  Regulation number of Cite III/21.3 changed to III/22.3 per SOLAS Amendments.

III/22.4.1.2  Regulation number of Cite III/21.4.2.2 changed to III/22.4.1.2 per SOLAS Amendments.

III/23  Regulation number of Cite III/22 changed to III/23 per SOLAS Amendments.

Section II  Nov. 1, 2002
II/44  Added Regulation 44 to agree with the USCG “A60” Construction for space around the emergency source of power.

Sections IV and V  Nov. 1, 2002
Revised Check Sheets ACP CS, SS, ES and NCS.

Cite II-2/56.6 deleted since part of SOLAS.

Section III April 22, 2003

Cite III-4 original wording replaced with new paragraphs.

Revised Cite III-17 to 18, cite III-27.3 to 32.3 added /inserted for each person and regardless if it has totally enclosed lifeboats.

Revised Cite III/41 to 33; revised cite III/34 LSA Code 6.1.2.9, 6.1.2.

Revised, corrected and clarified as per USCG letter dated May 14, 2003.

General Equipment Approval changed Union to Community, MarED to MED.

Cite: III/4 160.115 added “if winches for Rescue Boats***.”

Cite: III/4 160.132 added “if davits for Rescue Boats***.”

General May 20, 2003

Changed date on Front Page from January 1 to June 1. Added USCG approval date June 9, 2003.

Section II May 20, 2003

Made site corrections II-2/44 to 9.2.3.3, II-2/45 to 13, II-2/61 to 10.4 and FSS Code C Chapter 14.
General Jan. 3, 2007
Revised applicable to the latest Rules, Standards, Special Decisions, Reporting.

Introduction Jan. 3, 2007
Revised how to handle Form 835, revised authorization relative to SOLAS exemptions, drydock inspection for passenger vessels, editorial and clarifications, USPHS application requirements, supplemental reporting, added gas/chemical carrier details. New added Subchapter L cargo vessels, oil recovery vessels, oceanography research vessels.

Section I Jan. 3, 2007
Revised 4-3-4/1, 4-8-3/5.5.4, 4-6-2/5.9; added cite 5-8-1/1 and 5-9-1/1, 4-8-2/5.19, 7.4 7.7, 4-8-4/21.1.6.

Section II Jan. 3, 2007
Deleted cite III/32.3 covered by the Rules, added new “Table Navigating Equipment”; revised cite II/10.3, II-2/10.5.4, II/10.5.4, II/10.6; added cite II-2/9.2.3.1, revised Table concerning SOLAS Equipment, added Pilot Ladder.

Section III Jan. 3, 2007
Added Annex VI, Incinerator. Added reference to USPHS.

Section VI Jan. 3, 2007
Revised Survey Check Sheets; revised Cite II-1/8, added 46 CFR 63.25-9.

Section VIII Jan. 3, 2007
New references added for information only.

Section VIII to X Aug. 22, 2008
Renumbered sections: VII is IBC Code, VIII is IGC Code, IX is References and X is Records. Incorporated editorial comments.

Sections All Aug. 22, 2008
Incorporated USCG comments 23 March 2008. Revised all headers to match SOLAS Regulations and the FSS code.

Introduction Aug. 22, 2008
Added Offshore Supply Vessels (OSV’s) over 90 meters in length.

### Introduction Mar. 10, 2009

New and revised headings: Introduction, Procedures, Form 835 CG, Dry Docking, Supplemental Reporting, Renumbering, etc., Incorporated USCG comments dated 23 February 2009.
